Performance simulation of modular product architectures by model-based configuration Florian M. Dambietz, 2021-09-30 The use of modular product architectures can significantly increase the efficiency in manufacturing companies Various modularization methods are used in the development of these architectures but they always result in different architecture alternatives This thesis describes the development of a model based simulation for multi dimensional performance assessment of these architecture alternatives with their corresponding modular kits The central element of this simulation is formed by a model based configuration system identifying individually valid product variants using concepts and tools of Model based systems engineering MBSE Based on the developed Hyperspace algorithm a geometric mathematical solution approach these variants are then evaluated considering multiple parameters By recursively configuring multiple customer requests using alternative modular kits an individual performance criterion of these alternatives can be generated including customer market and company parameters This thesis describes the development of the performance simulation on the basis of a simplified explanation example A validation based on customer specific laser welding systems is also shown
