New Insights and Controversies in Diagnosis and Treatment of Adult Growth Hormone Deficiency Antonio Mancini, Luca Persani, Maura Arosio, Ilonka Kreitschmann-Andermahr, 2023-06-19 Adult growth hormone deficiency aGHD is the clinical expression of a reduced GH secretion caused by congenital or acquired diseases affecting the hypothalamus pituitary axis Once considered a rare clinical disorder its prevalence is apparently increasing Nevertheless due to the subtle clinical manifestations aGHD could be still underestimated Thirty years of experience with recombinant GH rh GH clearly indicate the beneficial effects of

replacement therapy with amelioration of metabolic and inflammatory parameters body composition endothelial function quality of life and reduction of cardiovascular risk Furthermore the world of GH and aGHD is rapidly enriching new information on GH physiology regarding its metabolic role and pleiotropic activities is spreading thus even making inappropriate the same name of growth hormone The definition of functional and partial aGHD is still unclear and debated although data about partially impaired GH secretion showed alteration of some metabolic and clinical parameters associated with cardiovascular risk Current guidelines about GHD diagnosis and treatment have been elaborated but many questions remain debated New tests for diagnosis have recently been proposed and non conventional indications for diagnosis and treatment deserve further investigations Controlled trials on the beneficial effects on morbidity and mortality are still lacking and new formulations of GH are under investigation Several questions are related to the age of affected patients from transition age to ageing and no indications are available on how long the therapy should be considered Other concerns are related to a possible pro oncogenic effect especially in patients who develop the deficiency after a removal of a hypothalamic pituitary tumor The interrelations with other pituitary axes need further clarification since isolate GHD and multiple pituitary deficiencies may have a different spectrum of manifestation The aim of this Research Topic is to furnish deeper insight to questions related to aGHD from molecular pathways involved in the pathophysiology to diagnostic tools and replacement therapy

Cardiovascular and Metabolic Comorbidities in Pituitary Disorders Pawel Krzesinski, Corin Badiu, Marek Bolanowski, Przemyslaw Witek, 2024-06-12 Pituitary disorders may be associated with an increased risk of cardiovascular and metabolic complications and in consequence increased mortality Excessive secretion of pituitary hormones provokes functional and systemic abnormalities which can be manifested by cardiovascular complications such as eg arterial hypertension heart failure arrhythmia as through metabolic disturbances including obesity and diabetes Subclinical effects of pituitary diseases such as cardiac and vascular dysfunction also modifies prognosis but due to its asymptomatic course are frequently diagnosed with significant time delay Even successful surgery and pharmacological treatment of pituitary disorders do not guarantee that metabolic and cardiovascular comorbidities can be completely resolved after primary disease remission This Research Topic aims to provide insights into the cross talk between pituitary and cardiometabolic disorders in respect to effective diagnosis and targeted therapy We also especially welcome studies that advance our knowledge on molecular mechanisms and pathogenic pathways explaining these phenomena Another issue that still needs clarification is an effective model of interdisciplinary care focused on holistic approach to patients with pituitary disorders We would like to turn on a light of attention towards the importance of psychological dietary and rehabilitation care We aim to collect the up to date studies presenting novel results and future perspectives in this area In this Research Topic we welcome the submission of original research reviews and expert opinions that include but are not limited to the following areas in pituitary disorders prevalence of cardiovascular and metabolic comorbidities molecular mechanisms and pathogenic pathways of

cardiovascular and metabolic complications novel diagnostic tools and biochemical markers to detect early cardiovascular and metabolic complications individualized treatment of cardiovascular and metabolic complications reversibility of cardiovascular and metabolic abnormalities after biochemical control of primary endocrine dysfunction optimal model of interdisciplinary care diet psychological support rehabilitation
