Lewis, 2006-03-31 A scientific approach to the new field of critical infrastructure protection This book offers a unique scientific approach to the new field of critical infrastructure protection it uses network theory optimization theory and simulation software to analyze and understand how infrastructure sectors evolve where they are vulnerable and how they can best be protected The author demonstrates that infrastructure sectors as diverse as water power energy telecommunications and the Internet have remarkably similar structures This observation leads to a rigorous approach to vulnerability analysis in all of these sectors The analyst can then decide the best way to allocate limited funds to minimize risk regardless of industry sector The key question addressed in this timely book is What should be protected and how The author proposes that the answer lies in allocating a nation's scarce resources to the most critical components of each infrastructure the so called critical nodes Using network theory as a foundation readers learn how to identify a small handful of critical nodes and then allocate resources to reduce or eliminate risk across the entire sector A comprehensive set of electronic media is provided on a CD ROM in the back of the book that supports in class and self tutored instruction Students can copy these professionally produced audio video lectures onto a PC Microsoft Windows r and Apple Macintosh r compatible for repeated viewing at their own pace Another unique feature of the book is the open source software for demonstrating concepts and streamlining the math needed for vulnerability analysis Updates as well as a discussion forum are available from www.CHDS.us This book is essential for all corporate government agency and military professionals tasked with assessing vulnerability and developing and implementing protection systems In addition the book is recommended for upper level undergraduate and graduate
