

CONDENSATE MECHANICS

Condensate forms in air conditioning systems and industrial processes and is a byproduct of various chemical reactions. Efficient removal of this condensate is crucial for maintaining system performance and preventing damage.

Condensate is typically collected in a reservoir or sump and then pumped out of the system. The pump must be capable of handling the volume of condensate and the height of the discharge line. The pump also must be able to handle any debris that may be present in the condensate. The pump should be sized to handle the maximum flow rate of condensate and should be able to operate at the required pressure.

CONDENSATE PUMP

The condensate pump is a device that moves condensate from the collection reservoir to the discharge point. It is typically a small, self-contained unit that can be installed in a variety of locations.

- The pump should be capable of handling the maximum flow rate of condensate and should be able to operate at the required pressure.
- The pump should be able to handle any debris that may be present in the condensate.
- The pump should be sized to handle the maximum flow rate of condensate and should be able to operate at the required pressure.
- The pump should be able to handle any debris that may be present in the condensate.
