BIOMES

Take a closer look at the images above. Each is home to a variety of plants and animals, but no two are the same. Although they're all capable to life, there are quite a lot of differences too. Many of these differences are **abiotic**, or have to do with the non-living parts of the environment. Abiotic factors include temperature, the amount of oxygen in the air or water, and the kind of soil present.

infer, or make your best guess, about some of the abiotic factors in each of the images.

Location	Temperature	Amount of rainfall

C		

Specifying these locations are all home to many trees, or living, factors as well. What kinds of species do you think live in each of these places? Feel free to list plants, animals, birds, fish, insects, and even microscopic life like bacteria!

Lastly, the **chapparral** biome is a coastal biome with hot, dry summers and mild winters. It has mostly shrubs with a few short trees. Deer, birds, and rabbits live in the chapparral.

The **Tundra** in Alaska is the largest cold desert, but there is so much snow (and) that it's still considered a desert. Both plants and animals must adapt to dry life in the desert. Many develop unique ways of surviving such as water storage.

Earth is an amazing planet. It has many different environments that make perfect homes for millions of species. The largest major habitats that exist worldwide are known as **biomes**. Most likely, you're familiar with many of these: desert, rainforest, grassland, etc. Each biome is unique and has its own set of characteristics that make it different from the others. The study of biomes is called **biogeography**, or the amazing variety of life that makes our Earth so abundant in biodiversity.

How many biomes are there? Do all water environments constitute a single aquatic biome? Are all fire-filled ecosystems considered a forest biome? The number of biomes you could simply depend on how specific you'd like to be. Let's take a look at some of the largest biomes, and the abiotic and biotic factors that define them.

Marine

Freshwater

Savanna

For fish, birds, frogs, whales, and other aquatic species. **Aquatic Biomes** Since water covers over 70% of the Earth, the largest biomes are the aquatic biomes. Marine biomes include coral reefs and estuaries, but the two major ones are the marine and freshwater biomes. The **marine** biome, made up of the world's oceans, is so big it's usually divided into **deep-sea** and **shallow-sea** biomes. It's so big, the deep-sea is actually 4 times larger than all of Earth's other biomes combined. The **freshwater** biome, on the other hand, is much smaller. It includes lakes, rivers, and ponds. The **freshwater** biome is especially important to us because it provides the water that we use to drink. All aquatic biomes provide homes for diverse plant and animal life. The **marine** biomes provide oxygen through photosynthesis.

Grassland Grassland biomes live up to their name! They're made up of open and very few trees. The two major grassland biomes are the **savanna** and **temperate grassland**. The **savanna** is a type of grassland that covers half of Africa and large parts of Australia. These areas have a 6-8 month wet season in the summer and a 4-6 month dry season in the winter. The **temperate grasslands**, on the other hand, make up the plains of middle America.
