Behavioral Decision Analysis Florian M. Federspiel,Gilberto Montibeller,Matthias Seifert,2024-05-30 This book lays out a foundation and taxonomy for Behavioral Decision Analysis featuring representative work across various domains Traditional research in the domain of Decision Analysis has focused on the design and application of logically consistent tools to support decision makers during the process of structuring problem complexity modeling uncertainty generating predictions eliciting preferences and ultimately making better decisions Two commonly held assumptions are that the decision maker s cognitive belief system is fully accessible and that this system can be understood and formalized by trained analysts However in past years an active line of research has emerged studying instances in which such assumptions may not hold This book unites this community under the common theme of Behavioral Decision Analysis The taxonomy used in this book categorizes research based on task focus prediction or decision and behavioral level individual or group Two theoretical lenses that lie at the interface between 1 normative and descriptive research and 2 normative and prescriptive research are introduced The book then proceeds to highlight representative works across the two lenses focused on individual and group level decision making Featuring various methodologies and applications the book serves as a reference for researchers students and professionals across different disciplines with a common interest in Behavioral Decision Analysis

Generalized

Concavity in Fuzzy Optimization and Decision Analysis Jaroslav Ramík, Milan Vlach, 2012-12-06 Convexity of sets in linear spaces and concavity and convexity of functions lie at the root of beautiful theoretical results that are at the same time extremely useful in the analysis and solution of optimization problems including problems of either single objective or multiple objectives Not all of these results rely necessarily on convexity and concavity some of the results can guarantee that each local optimum is also a global optimum giving these methods broader application to a wider class of problems Hence the focus of the first part of the book is concerned with several types of generalized convex sets and generalized concave functions In addition to their applicability to nonconvex optimization these convex sets and generalized concave functions are used in the book's second part where decision making and optimization problems under uncertainty are investigated Uncertainty in the problem data often cannot be avoided when dealing with practical problems Errors occur in real world data for a host of reasons However over the last thirty years the fuzzy set approach has proved to be useful in these situations It is this approach to optimization under uncertainty that is extensively used and studied in the second part of this book Typically the membership functions of fuzzy sets involved in such problems are neither concave nor convex They are however often quasiconcave or concave in some generalized sense This opens possibilities for application of results on generalized concavity to fuzzy optimization Despite this obvious relation applying the interface of these two areas has been limited to date It is hoped that the combination of ideas and results from the field of generalized concavity on the one hand and fuzzy optimization on the other hand outlined and discussed in *Generalized Concavity in Fuzzy Optimization and Decision Analysis* will be of interest to both communities Our aim is to broaden the classes of problems that the combination of these two areas can satisfactorily address and solve

Handbook of Metaheuristics Fred W.

Glover, Gary A. Kochenberger, 2006-04-11 Metaheuristics in their original definition are solution methods that orchestrate an interaction between local improvement procedures and higher level strategies to create a process capable of escaping from local optima and performing a robust search of a solution space Over time these methods have also come to include any procedures that employ strategies for overcoming the trap of local optimality in complex solution spaces especially those procedures that utilize one or more neighborhood structures as a means of defining admissible moves to transition from one solution to another or to build or destroy solutions in constructive and destructive processes The degree to which neighborhoods are exploited varies according to the type of procedure In the case of certain population based procedures such as genetic algorithms neighborhoods are implicitly and somewhat restrictively defined by reference to replacing components of one solution with those of another by variously chosen rules of exchange popularly given the name of crossover In other population based methods based on the notion of path relinking neighborhood structures are used in their full generality including constructive and destructive neighborhoods as well as those for transitioning between complete solutions Certain hybrids of classical evolutionary approaches which link them with local search also use neighborhood structures more fully though apart from the combination process itself

Multicriteria Decision Making

Timothy Havranek, Doug MacNair, 2023-06-06 Public corporations and private businesses operate in an increasingly complex uncertain and interconnected world When evaluating investment decisions business managers can no longer base their decisions primarily on expected financial return They now must now consider a host of performance value measures i.e. criteria pertaining to issues such as environmental and social governance sustainability and stakeholder satisfaction In addition corporate managers must ensure that their investment decisions are aligned with the company's vision mission and values in order to maintain investor confidence and protect brand image Lastly to be truly successful business managers must assess the risks associated with each performance measure and manage their impacts during project implementation This book takes a pragmatic business and economics view towards evaluating competing investment alternatives and or capital project strategies It provides a practical step by step process using a structured decision analysis framework to evaluate understand quantify and measure project investment strategies in light of multiple stakeholder objectives and success criteria This process assists in helping stakeholders internal and external achieve a shared understanding of project issues and to facilitate convergence towards a mutually acceptable solution The approach considers available choices identified uncertainties constraints necessary tradeoffs and preferences so as to identify solutions that maximize overall benefits while minimizing overall costs and risk A real world case study is presented in the early chapters and the process steps are demonstrated through application to this case study Recent advances in technology allow for investment strategies to be evaluated against multiple criteria within one integrated platform This book guides the reader in performing multicriteria decision analysis including the use of Monte Carlo simulation within an MS Excel environment using native MS Excel

and as well as add in programs such Palisades Decision Tools suite Example model structures screen shots formulas and output results are provided throughout the book using an illustrative case study Preference Disaggregation in Multiple Criteria Decision Analysis Nikolaos Matsatsinis, Evangelos Grigoroudis, 2018-05-29 This book presents the main principles of preference disaggregation analysis and covers theoretical advances in preference modelling group decision making classification methods robustness analysis process mining and decision support systems In addition it highlights several applications of the preference disaggregation analysis in a wide range of areas such as customer satisfaction analysis consumer behavior energy and environmental policy strategy development and agricultural marketing This book was published in honor of Yannis Siskos on the occasion of his retirement from the University of Piraeus Greece It offers a unique snapshot of the preference disaggregation philosophy in multiple criteria decision analysis and presents a range of research ideas many of which were significantly influenced by Professor Siskos work **Multi-Criteria Decision Analysis**

Foundations Models and Methods fully addresses the questions of What is health risk analysis and How can its potentialities be developed to be most valuable to public health decision makers and other health risk managers Risk analysis provides methods and principles for answering these questions It is divided into methods for assessing communicating and managing health risks Risk assessment quantitatively estimates the health risks to individuals and to groups from hazardous exposures and from the decisions or activities that create them It applies specialized models and methods to quantify likely exposures and their resulting health risks Its goal is to produce information to improve decisions It does this by relating alternative decisions to their probable consequences and by identifying those decisions that make preferred outcomes more likely Health risk assessment draws on explicit engineering biomathematical and statistical consequence models to describe or simulate the causal relations between actions and their probable effects on health Risk communication characterizes and presents

information about health risks and uncertainties to decision makers and stakeholders Risk management applies principles for choosing among alternative decision alternatives or actions that affect exposure health risks or their consequences

engineering problems are structured as classical problems in multiple criteria decision analysis and the relevant methodologies are demonstrated

Quantitative Health Risk Analysis Methods Louis Anthony Cox Jr., 2006-03-17 This book grew out of an effort to salvage a potentially useful idea for greatly simplifying traditional quantitative risk assessments of the human health consequences of using antibiotics in food animals In 2001 the United States FDA's Center for Veterinary Medicine CVM FDA CVM 2001 published a risk assessment model for potential adverse human health consequences of using a certain class of antibiotics fluoroquinolones to treat flocks of chickens with fatal respiratory disease caused by infectious bacteria CVM's concern was that fluoroquinolones are also used in human medicine raising the possibility that fluoroquinolone resistant strains of bacteria selected by use of fluoroquinolones in chickens might infect humans and then prove resistant to treatment with human medicines in the same class of antibiotics such as ciprofloxacin As a foundation for its risk assessment model CVM proposed a dramatically simple approach that skipped many of the steps in traditional risk assessment The basic idea was to assume that human health risks were directly proportional to some suitably defined exposure metric In symbols $\text{Risk} \propto \text{Exposure}$ where Exposure would be defined in terms of a metric such as total production of chicken contaminated with fluoroquinolone resistant bacteria that might cause human illnesses and Risk would describe the expected number of cases per year of human illness due to fluoroquinolone resistant bacterial infections caused by chicken and treated with fluoroquinolones
