## **Handbook Of Vascular Biology Techniques:**

**Handbook of Vascular Biology Techniques** Mark Slevin, Garry McDowell, 2015-03-27 A wide range of research methods for the study of vascular development from basic laboratory protocols to advanced technologies used in clinical practice are covered in this work A range of methodologies such as molecular imaging platforms and signalling analysis along with tumour models are collated here Four sections explore in vitro techniques in vivo and ex vivo manipulations imaging and histological analysis and other novel techniques in vascular biology Readers will discover basic methodologies used for analysis of endothelial cell growth in vitro including co culture models of vessel formation Authors also explore isolation and purification of cells and methods for analysis of data and visualization of localized vasculature with modern imaging platforms Both animal models and human disease are covered in this work Each chapter contains helpful sections on trouble shooting additional notes and links supporting the reader to carry out protocols This book will appeal to students researchers and medical professionals working in all vascular linked fields such as cardio and cerebrovascular cancer and dementia

**Vascular Biology Protocols** Nair Sreejayan, Jun Ren, 2008-07-25 Over the past decades the pathogenesis diagnosis treatment and prevention of cardiovascular diseases have been benefited significantly from intensive research activities In order to provide a comprehensive manual in a field that has become as broad and deep as cardiovascular medicine this volume of Methods in Molecular Medicine covers a wide spectrum of in vivo and in vitro techniques encompassing biochemical pharmacological and molecular biology disciplines which are currently used to assess vascular disease progression Each chapter included in this volume focuses on a specific vascular biology technique and describes various applications as well as caveats of these techniques The protocols included here are described in detail allowing beginners with little experience in the field of vascular biology to embark on new research projects

**Investigating mechanisms of angiogenesis in health and disease using zebrafish models** Zaheer Ali, 2018-12-07 Angiogenesis the growth of blood vessels from an existing vasculature can occur by sprouting from preexisting vessels or by vessel splitting intussusception Pathological angiogenesis drives choroidal neovascularization CNV in age related macular degeneration AMD which is commonly restricted under the retinal pigment epithelium RPE called occult CNV but may also involve vessels penetrating through the RPE into the sub retinal space Pathological vessels are poorly developed insufficiently perfused and highly leaky phenotypes that are considered to drive disease progression and lead to poor prognosis Currently a number of anti angiogenic drugs exists the majority of which target vascular endothelial factor VEGF but although they often are highly beneficial for treating eye diseases in the short term they are generally of limited efficacy in other diseases such as cancer and also have poorer efficacy when used for treatment of eye diseases in the long term A better understanding of the mechanisms underlying pathological angiogenesis can generate new targets for treatment leading to development of better drugs for cancer and retinopathies but perhaps also other angiogenesis dependent diseases in the future In this thesis

mechanisms involved in developmental angiogenesis or pathological angiogenesis in the choroid, cornea or melanoma was identified. These findings highlight the need to further elaborate our knowledge related to angiogenesis in different tissues and conditions for a more targeted and potentially effective treatment of diseases in the future. In paper I we for the first time identified the choriocapillaries (CCs) in adult zebrafish and found that occult CNV could be induced by exposing the fish to severe hypoxia. Interestingly, we found that occult CNV relied on intussusception involving not only de novo generation of intussusceptive pillars but also a previously poorly understood mechanism called pillar splitting. This involved HIF-1, VEGF, and VEGFR2 signaling and evidence that this also occurred in both rats and humans suffering from AMD suggested that the mechanism was conserved and clinically relevant. In contrast, we found in paper II that the development of CCs in the zebrafish relies on sprouting angiogenesis involving continuous remodeling and delayed maturation of the vasculature. In 2D, the initial development was found to occur by a unique process of tissue-wide synchronized vasculogenesis. As expected, VEGFA via VEGFR2 was also critical for the development of these vessels in the zebrafish embryo, but surprisingly, this was independent of hypoxia-inducible factor HIF-1. Inflammatory nuclear factor  $\kappa$ B (NF- $\kappa$ B) signaling is involved in the progression of angiogenesis, but this signaling pathway has mainly been studied in inflammatory cells, and the role of NF- $\kappa$ B in the endothelial cells during angiogenesis is poorly understood. In paper III, we found that blocking NF- $\kappa$ B signaling using a specific IKK2 blocker, IMD0354, specifically blocks pathological as well as developmental angiogenesis by targeting endothelial cell NF- $\kappa$ B signaling in the endothelial cells. Using a rat model for suture-induced corneal neovascularization, IMD0354 treatment led to reduced production of inflammatory C-C motif chemokine ligand 2 (CCL2), C-X-C motif chemokine ligand 5 (CXCL5), and VEGF, and thereby reduced pathological corneal angiogenesis in this model. Using the zebrafish tumor xenograft model in paper IV, we found an association between Microphthalmia-associated transcription factor (MITF) and pigment epithelium-derived factor (PEDF), which was involved in pathological tumor angiogenesis and metastasis. Similarly, in paper V, we used zebrafish transplantation models to study and investigate the use of biocompatible polymers for the delivery of pro-angiogenic FGF-2 as a potential treatment strategy for ischemic diseases such as myocardial infarction (MI). Conclusively, this thesis provides new insights into diverse fields of angiogenic assays using zebrafish and reveals new mechanisms of angiogenesis in health and disease. This work will hopefully provide a foundation for further studies into occult CNV related to AMD, a process that has not been possible to study previously in pre-clinical models. In addition, zebrafish xenograft or other transplantation models used in this work will likely be important to study cancer biology and to develop more attractive pharmaceutical preparations based on biocompatible hydrogels formulated as microspheres in the future.
