Concise Epidemiologic Principles and Concepts - Second Edition Laurens Holmes, Jr, 2025-03-19 Concise Epidemiologic Principles Concepts Study Design Conduct and Application We often conceive epidemiology in either simplistic or complex terms and neither of these is accurate To illustrate this the complexities in epidemiology could be achieved by considering a study to determine the correlation between serum lipid profile as total cholesterol HDL LDL triglyceride and total body fatness or obesity measured by BMI in children Two laboratories measured serum lipid profiles and one observed a correlation with BMI while the other did not Which is the reliable finding To address this question one needs to examine the context of blood drawing since fasting blood level may provide a better indicator of serum lipid Epidemiologic studies could be easily derailed given the inability to identify and address possible confounding Therefore understanding the principles and concepts used in epidemiologic studies designed and conducted to answer clinical research questions facilitates accurate and reliable findings in these areas Another similar example in a health fair setting involves geography and health termed health ography The risk of dying in one zip code A was 59.5 per 100 000 and in the other zip code B was 35.4 per 100 000 There is a common sense and non epidemiologic tendency to conclude that there is an increased risk of dying in zip code A To arrive at such inference one must first find out the age distribution of these two zip codes since advancing age is associated with increased mortality Indeed zip code A is comparable to the United States population while zip code B is the Mexican population These two examples are indicative of the need to understand epidemiologic concepts such as confounding by age or effect measure modification prior to undertaking clinical research This textbook describes the basics of research in medical and clinical settings as well as the concepts and application of epidemiologic designs in research Design transcends statistical techniques and no matter how sophisticated statistical modeling errors of design sampling cannot be corrected The author of this textbook has presented a complex field in a very simplified and reader friendly manner with the intent that such a presentation will facilitate the understanding of the design process and epidemiologic thinking in clinical research Additionally this book provides a very basic explanation of how to examine the data collected for research conduct for the possibility of confounders and how to address such confounders thus disentangling such effects for reliable and valid inference Research is presented as an exercise around measurement with measurement error inevitable in its conduct hence the inherent uncertainties of all findings in clinical and medical research Concise Epidemiologic Principles and Concepts Second Edition for Clinicians covers research conceptualization namely research objectives questions hypothesis design implementation data collection analysis results and interpretation While the primary focus of epidemiology is to assess the relationship between exposure risk or predisposing factor and outcome disease or health related event the causal association is presented in a simplified manner including the role of quantitative evidence synthesis QES in causal

inference Epidemiology has evolved over the past three decades resulting in several fields being developed This text presents in brief the perspectives and future of epidemiology in the era of the molecular basis of medicine 3Ts and systems science as well as Epigenomic Epidemiology Epidemiologic evidence is more reliable if conceptualized and conducted within the context of translational transdisciplinary and team science With molecular epidemiology we are better equipped with tools to identify molecular biologic indicators of risk as well as biologic alterations in the early stages of disease and with 3 Ts and systems science we are more capable of providing accurate and reliable inference on causality and outcomes research Further the author argues that unless sampling error and confounding are identified and addressed clinical research findings will remain largely inconsistent implying an inconsequential epidemiologic approach Appropriate knowledge of research conceptualization design and statistical inference is essential for conducting clinical and biomedical research This knowledge is acquired through the understanding of epidemiologic observational non experimental and experimental designs and the choice of the appropriate test statistic for statistical inference However regardless of how sophisticated the statistical technique employed for statistical inference is study conceptualization and design are the building blocks of valid scientific evidence Since clinical research is performed to improve patients care it remains relevant to assess not only the statistical significance but the clinical and biologic importance of the findings for clinical decision making in the care of an individual patient Therefore the aim of this book is to provide clinicians biomedical researchers graduate students in research methodology students of public health and all those involved in clinical biomedical research with a simplified but concise overview of the principles and practice of epidemiology In addition the author stresses common flaws in the conduct analysis and interpretation of epidemiologic studies Valid and reliable scientific research is that which considers the following elements in arriving at the truth from the data namely biological relevance clinical importance and statistical stability and precision statistical inference based on the p value and the 90 95 and 99 percent confidence interval The interpretation of results of new research must rely on factual association or effect and the alternative explanation namely systematic error random error precision confounding and effect measure modifier Therefore unless these perspectives are disentangled the results from any given research cannot be considered reliable However even with this disentanglement all study findings remain inconclusive with some degree of uncertainty This book presents a comprehensive guide on how to conduct clinical and medical research mainly research question formulation study implementation hypothesis testing using appropriate test statistics to analyze the data and results interpretation In so doing it attempts to illustrate the basic concepts used in study conceptualization epidemiologic design and appropriate test statistics for statistical inference from the data Therefore though statistical inference is emphasized throughout the presentation in this text equal emphasis is placed on clinical relevance or importance and biological relevance in the interpretation of the study results Specifically this book describes in basic terms and concepts how to conduct clinical and medical research using epidemiologic designs The author presents

epidemiology as the main profession in the trans disciplinary approach to the understanding of complex ecologic models of disease and health Clinicians even those without preliminary or infantile knowledge of epidemiologic designs could benefit immensely from what when where who and how studies are conceptualized data collected as planned with the scale of measurement of the outcome and independent variables data edited cleaned and processed prior to analysis appropriate analysis based on statistical assumptions and rationale results tabulation for scientific appraisal results interpretation and inference Unlike most epidemiologic texts this is the first book that attempts to simplify complex epidemiologic methods for users of epidemiologic research namely clinicians and allied health researchers Additionally it is rare to find a book with integrates of basic research methodology into epidemiologic designs Finally research innovation and the current challenges of epidemiology are presented in this book to reflect the currency of the materials and the approach as well as the responses to the challenges of epidemiology today namely epigenomic epidemiology in environmental and gene interaction disease determinants A study could be statistically significant but biologically and clinically irrelevant since the statistical stability of a study does not rule out bias and confounding The p value is deemphasized while the use of effect size or magnitude and confidence intervals in the interpretation of results for application in clinical decision making is recommended The use of p value could lead to an erroneous interpretation of the effectiveness of treatment For example studies with large sample sizes and very little or insignificant effects of no clinical importance may be statistically significant while studies with small samples though a large magnitude of effects are labeled negative result i Such results are due to low statistical power and increasing variability hence the inability to pass the arbitrary litmus test of the 5 percent significance level Epidemiology Conceptualized Epidemiologic investigation and practice are as old as the history of modern medicine It dates back to Hippocrates circa 2 400 years ago In recommending the appropriate practice of medicine Hippocrates appealed to the physicians ability to understand the role of environmental factors in predisposition to disease and health in the community During the Middle Ages and the Renaissance epidemiologic principles continued to influence the practice of medicine as demonstrated in De Morbis Artificum 1713 by Ramazzini and the works on scrotal cancer in relation to chimney sweeps by Percival Pott in 1775 With the works of John Snow a British physician 1854 on cholera mortality in London the era of scientific epidemiology began By examining the distribution pattern of mortality and cholera in London Snow postulated that cholera was caused by contaminated water Epidemiology Today Epigenomic Epidemiology There are several definitions of epidemiology but a practical definition is necessary for the understanding of this science and art Epidemiology is the basic science of public health The objective of this profession is to assess the distribution and determinants of disease disabilities injuries natural disasters tsunamis hurricanes tornados and earthquakes and health related events at the population level Epidemiologic investigation or research focuses on a specific population The basic issue is to assess the groups of people at higher risk women children men pregnant women teenagers whites African Americans Hispanics Asians poor affluent gay

lesbians married single older individuals etc Epidemiology also examines how the frequency of the disease or the event of interest changes over time In addition epidemiology examines the variation of the disease of interest from place to place Simply descriptive epidemiology attempts to address the distribution of disease with respect to who when and where For example cancer epidemiologists attempt to describe the occurrence of prostate cancer by observing the differences in populations by age socioeconomic status occupation geographic locale race ethnicity etc Epidemiology also attempts to address the association between the disease and exposure For example why are some men at high risk for prostate cancer Does race ethnicity increase the risk for prostate cancer Simply is the association causal or spurious This process involves the effort to determine whether a factor exposure is associated with the disease outcome In the example of prostate cancer such exposure includes a high fat diet race ethnicity advancing age pesticides family history of prostate cancer and so on Whether or not the association is factual or a result of chance remains the focus of epidemiologic research The questions to be raised are as follows Is prostate cancer associated with pesticides Does pesticide cause prostate cancer Epidemiology often goes beyond disease exposure association or relationship to establish a causal association In this process of causal inference it depends on certain criteria one of which is the strength or magnitude of association leading to the recommendation of preventive measures However complete knowledge of the causal mechanism is not necessary prior to preventive measures for disease control Further findings from epidemiologic research facilitate the prioritization of health issues and the development and implementation of intervention programs for disease control and health promotion Epidemiology today reflects the application of gene and environment interaction in disease causation morbidity prognosis survival and mortality in subpopulation health outcomes The knowledge and understanding of subpopulation differentials in DNA methylation of specific genes and histone modification allows for the application of abnormal transcriptomes impaired gene expression protein synthesis dysfunctionality and abnormal cellular functionality This book is conceptually organized into three sections Section I deals with research methods section II epidemiologic designs as well as causal inference and perspectives in epidemiology while section III delves into perspectives epidemiologic challenges and special topics in epidemiology namely epidemiologic tree challenges emerging fields the consequentialist perspective of epidemiology and epidemiologic role in health and healthcare policy formulation as well as epigenomic epidemiology and epigenomic determinants of health EDH Throughout this book attempts are made to describe the research methods and non experimental as well as experimental designs Section I comprises research methods with an attempt to describe the following Research objectives and purposes Research questions Hypothesis statements null and alternative Rationales for research clinical reasoning and diagnostic tests as well as Study conceptualization and conduct research question data collection data management hypothesis testing data analysis Ovarian Cancers National Academies of Sciences, Engineering, and Medicine, Institute of Medicine, Board on Health Care Services, Committee on the State of the Science in

Ovarian Cancer Research,2016-04-25 In an era of promising advances in cancer research there are considerable and even alarming gaps in the fundamental knowledge and understanding of ovarian cancer Researchers now know that ovarian cancer is not a single disease several distinct subtypes exist with different origins risk factors genetic mutations biological behaviors and prognoses However persistent questions have impeded progress toward improving the prevention early detection treatment and management of ovarian cancers Failure to significantly improve morbidity and mortality during the past several decades is likely due to several factors including the lack of research being performed by specific disease subtype lack of definitive knowledge of the cell of origin and disease progression and incomplete understanding of genetic and non genetic risk factors Ovarian Cancers examines the state of the science in ovarian cancer research identifies key gaps in the evidence base and the challenges to addressing those gaps considers opportunities for advancing ovarian cancer research and examines avenues for translation and dissemination of new findings and communication of new information to patients and others This study makes recommendations for public and private sector efforts that could facilitate progress in reducing the incidence of morbidity and mortality from ovarian cancers

Concise Epidemiologic Principle and Concepts - Second Edition Laurens Holmes, Jr,2025-03-20 Concise Epidemiologic Principles and Concepts Aberrant Epigenomic Modulations Implication We often conceive epidemiology in either simplistic or complex terms and neither of these is accurate To illustrate this the complexities in epidemiology could be achieved by considering a study to

determine the correlation between serum lipid profile as total cholesterol HDL LDL triglyceride and total body fatness or obesity measured by BMI in children Two laboratories measured serum lipid profiles and one observed a correlation with BMI while the other did not Which is the reliable finding To address this question one needs to examine the context of blood drawing since fasting blood level may provide a better indicator of serum lipid Epidemiologic studies could be easily derailed given the inability to identify and address possible confounding Therefore understanding the principles and concepts used in epidemiologic studies designed and conducted to answer clinical research questions facilitates accurate and reliable findings in these areas Another similar example in a health fair setting involves geography and health termed health ography The risk of dying in one zip code A was 59.5 per 100,000 and in the other zip code B was 35.4 per 100,000 There is a common sense and non epidemiologic tendency to conclude that there is an increased risk of dying in zip code A To arrive at such inference one must first find out the age distribution of these two zip codes since advancing age is associated with increased mortality Indeed zip code A is comparable to the United States population while zip code B is the Mexican population These two examples are indicative of the need to understand epidemiologic concepts such as confounding by age or effect measure modification prior to undertaking clinical research This textbook describes the basics of research in medical and clinical settings as well as the concepts and application of epidemiologic designs in research Design transcends statistical techniques and no matter how sophisticated statistical modeling errors of design sampling cannot be corrected The author of this textbook has presented a complex field in a very simplified and reader friendly manner with the intent that such a presentation will facilitate the understanding of the design process and epidemiologic thinking in clinical research Additionally this book provides a very basic explanation of how to examine the data collected for research conduct for the possibility of confounders and how to address such confounders thus disentangling such effects for reliable and valid inference Research is presented as an exercise around measurement with measurement error inevitable in its conduct hence the inherent uncertainties of all findings in clinical and medical research Concise Epidemiologic Principles and Concepts Second Edition for Clinicians covers research conceptualization namely research objectives questions hypothesis design implementation data collection analysis results and interpretation While the primary focus of epidemiology is to assess the relationship between exposure risk or predisposing factor and outcome disease or health related event the causal association is presented in a simplified manner including the role of quantitative evidence synthesis QES in causal inference Epidemiology has evolved over the past three decades resulting in several fields being developed This text presents in brief the perspectives and future of epidemiology in the era of the molecular basis of medicine 3Ts and systems science as well as Epigenomic Epidemiology Epidemiologic evidence is more reliable if conceptualized and conducted within the context of translational transdisciplinary and team science With molecular epidemiology we are better equipped with tools to identify molecular biologic indicators of risk as well as biologic alterations in the early stages of disease and with 3 Ts and systems

science we are more capable of providing accurate and reliable inference on causality and outcomes research Further the author argues that unless sampling error and confounding are identified and addressed clinical research findings will remain largely inconsistent implying an inconsequential epidemiologic approach Appropriate knowledge of research conceptualization design and statistical inference is essential for conducting clinical and biomedical research This knowledge is acquired through the understanding of epidemiologic observational non experimental and experimental designs and the choice of the appropriate test statistic for statistical inference However regardless of how sophisticated the statistical technique employed for statistical inference is study conceptualization and design are the building blocks of valid scientific evidence Since clinical research is performed to improve patients care it remains relevant to assess not only the statistical significance but the clinical and biologic importance of the findings for clinical decision making in the care of an individual patient Therefore the aim of this book is to provide clinicians biomedical researchers graduate students in research methodology students of public health and all those involved in clinical biomedical research with a simplified but concise overview of the principles and practice of epidemiology In addition the author stresses common flaws in the conduct analysis and interpretation of epidemiologic studies Valid and reliable scientific research is that which considers the following elements in arriving at the truth from the data namely biological relevance clinical importance and statistical stability and precision statistical inference based on the p value and the 90 95 and 99 percent confidence interval The interpretation of results of new research must rely on factual association or effect and the alternative explanation namely systematic error random error precision confounding and effect measure modifier Therefore unless these perspectives are disentangled the results from any given research cannot be considered reliable However even with this disentanglement all study findings remain inconclusive with some degree of uncertainty This book presents a comprehensive guide on how to conduct clinical and medical research mainly research question formulation study implementation hypothesis testing using appropriate test statistics to analyze the data and results interpretation In so doing it attempts to illustrate the basic concepts used in study conceptualization epidemiologic design and appropriate test statistics for statistical inference from the data Therefore though statistical inference is emphasized throughout the presentation in this text equal emphasis is placed on clinical relevance or importance and biological relevance in the interpretation of the study results Specifically this book describes in basic terms and concepts how to conduct clinical and medical research using epidemiologic designs The author presents epidemiology as the main profession in the trans disciplinary approach to the understanding of complex ecologic models of disease and health Clinicians even those without preliminary or infantile knowledge of epidemiologic designs could benefit immensely from what when where who and how studies are conceptualized data collected as planned with the scale of measurement of the outcome and independent variables data edited cleaned and processed prior to analysis appropriate analysis based on statistical assumptions and rationale results tabulation for scientific appraisal results interpretation and

inference Unlike most epidemiologic texts this is the first book that attempts to simplify complex epidemiologic methods for users of epidemiologic research namely clinicians and allied health researchers Additionally it is rare to find a book with integrates of basic research methodology into epidemiologic designs Finally research innovation and the current challenges of epidemiology are presented in this book to reflect the currency of the materials and the approach as well as the responses to the challenges of epidemiology today namely epigenomic epidemiology in environmental and gene interaction disease determinants Epidemiology Conceptualized Epidemiologic investigation and practice are as old as the history of modern medicine It dates back to Hippocrates circa 2 400 years ago In recommending the appropriate practice of medicine Hippocrates appealed to the physicians ability to understand the role of environmental factors in predisposition to disease and health in the community During the Middle Ages and the Renaissance epidemiologic principles continued to influence the practice of medicine as demonstrated in *De Morbis Artificum* 1713 by Ramazzini and the works on scrotal cancer in relation to chimney sweeps by Percival Pott in 1775 With the works of John Snow a British physician 1854 on cholera mortality in London the era of scientific epidemiology began By examining the distribution pattern of mortality and cholera in London Snow postulated that cholera was caused by contaminated water Epidemiology Today Epigenomic Epidemiology There are several definitions of epidemiology but a practical definition is necessary for the understanding of this science and art Epidemiology is the basic science of public health The objective of this profession is to assess the distribution and determinants of disease disabilities injuries natural disasters tsunamis hurricanes tornados and earthquakes and health related events at the population level Epidemiologic investigation or research focuses on a specific population The basic issue is to assess the groups of people at higher risk women children men pregnant women teenagers whites African Americans Hispanics Asians poor affluent gay lesbians married single older individuals etc Epidemiology also examines how the frequency of the disease or the event of interest changes over time In addition epidemiology examines the variation of the disease of interest from place to place Simply descriptive epidemiology attempts to address the distribution of disease with respect to who when and where For example cancer epidemiologists attempt to describe the occurrence of prostate cancer by observing the differences in populations by age socioeconomic status occupation geographic locale race ethnicity etc Epidemiology also attempts to address the association between the disease and exposure For example why are some men at high risk for prostate cancer Does race ethnicity increase the risk for prostate cancer Simply is the association causal or spurious This process involves the effort to determine whether a factor exposure is associated with the disease outcome In the example of prostate cancer such exposure includes a high fat diet race ethnicity advancing age pesticides family history of prostate cancer and so on Whether or not the association is factual or a result of chance remains the focus of epidemiologic research The questions to be raised are as follows Is prostate cancer associated with pesticides Does pesticide cause prostate cancer Epidemiology often goes beyond disease exposure association or relationship to establish a causal

association In this process of causal inference it depends on certain criteria one of which is the strength or magnitude of association leading to the recommendation of preventive measures However complete knowledge of the causal mechanism is not necessary prior to preventive measures for disease control Further findings from epidemiologic research facilitate the prioritization of health issues and the development and implementation of intervention programs for disease control and health promotion Epidemiology today reflects the application of gene and environment interaction in disease causation morbidity prognosis survival and mortality in subpopulation health outcomes The knowledge and understanding of subpopulation differentials in DNA methylation of specific genes and histone modification allows for the application of abnormal transcriptomes impaired gene expression protein synthesis dysfunctionality and abnormal cellular functionality
