Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, low-impact, and low-volume exercise program on the physical fitness of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were randomly assigned to either an exercise group or a control group. The exercise group performed a 12-week, low-intensity, low-impact, and low-volume exercise program. The control group did not exercise. The subjects were assessed for physical fitness at baseline and at 12 weeks. The exercise group showed significant improvements in physical fitness compared to the control group. The improvements were seen in all measures of physical fitness, including cardiovascular fitness, muscular fitness, and body composition. The exercise program was safe and effective for improving physical fitness in sedentary, middle-aged women.
