Large Networks and Graph Limits László Lovász, 2012 Recently it became apparent that a large number of the most interesting structures and phenomena of the world can be described by networks To develop a mathematical theory of very large networks is an important challenge This book describes one recent approach to this theory the limit theory of graphs which has emerged over the last decade The theory has rich connections with other approaches to the study of large networks such as property testing in computer science and regularity partition in graph theory It has several applications in extremal graph theory including the exact formulations and partial answers to very general questions such as which problems in extremal graph theory are decidable It also has less obvious connections with other parts of mathematics classical and non classical like probability theory measure theory tensor algebras and semidefinite optimization This book explains many of these connections first at an informal level to emphasize the need to apply more advanced mathematical methods and then gives an exact development of the theory of the algebraic theory of graph homomorphisms and of the analytic theory of graph limits This is an amazing book readable deep and lively It sets out this emerging area makes connections between old classical graph theory and graph limits and charts the course of the future Persi Diaconis Stanford University This book is a comprehensive study of the active topic of graph limits and an updated account of its present status It is a beautiful volume written by an outstanding mathematician who is also a great expositor Noga Alon Tel Aviv University Israel Modern combinatorics is by no means an isolated subject in mathematics but has many rich and interesting connections to almost every area of mathematics and computer science The research presented in Lovasz's book exemplifies this phenomenon This book presents a wonderful opportunity for a student in combinatorics to explore other fields of mathematics or conversely for experts in other areas of mathematics to become acquainted with some aspects of graph theory Terence Tao University of California Los Angeles CA Laszlo Lovasz has written an admirable treatise on the exciting new theory of graph limits and graph homomorphisms an area of great importance in the study of large networks It is an authoritative masterful text that reflects Lovasz's position as the main architect of this rapidly developing theory The book is a must for combinatorialists network theorists and theoretical computer scientists alike Bela Bollobas Cambridge University UK

Large Networks and Graph Limits László Lovász, 2012 *The Econometric Analysis of Network Data* Bryan Graham, Aureo de Paula, 2020-05-20 The Econometric Analysis of Network Data serves as an entry point for advanced students researchers and data scientists seeking to perform effective analyses of networks especially inference problems It introduces the key results and ideas in an accessible yet rigorous way While a multi contributor reference the work is tightly focused and disciplined providing latitude for varied specialties in one authorial voice **A Unified Approach to Structural Limits and Limits of Graphs with Bounded Tree-Depth** Jaroslav Nešetřil, Patrice Ossona de Mendez, 2020-04-03 In this paper the authors introduce a general framework for the study of limits of relational structures

and graphs in particular which is based on a combination of model theory and functional analysis The authors show how the various approaches to graph limits fit to this framework and that the authors naturally appear as tractable cases of a general theory As an outcome of this the authors provide extensions of known results The authors believe that this puts these into a broader context The second part of the paper is devoted to the study of sparse structures First the authors consider limits of structures with bounded diameter connected components and prove that in this case the convergence can be almost studied component wise They also propose the structure of limit objects for convergent sequences of sparse structures Eventually they consider the specific case of limits of colored rooted trees with bounded height and of graphs with bounded tree depth motivated by their role as elementary bricks these graphs play in decompositions of sparse graphs and give an explicit construction of a limit object in this case This limit object is a graph built on a standard probability space with the property that every first order definable set of tuples is measurable This is an example of the general concept of modeling the authors introduce here Their example is also the first intermediate class with explicitly defined limit structures where the inverse problem has been solved Extended Abstracts EuroComb 2021 Jaroslav Nešetřil, Guillem Perarnau, Juanjo Rué, Oriol Serra, 2021-08-23 This book collects the extended abstracts of the accepted contributions to EuroComb21 A similar book is published at every edition of EuroComb every two years since 2001 collecting the most recent advances in combinatorics graph theory and related areas It has a wide audience in the areas and the papers are used and referenced broadly
