Many-Body Schrödinger Dynamics of Bose-Einstein Condensates Kaspar Sakmann, 2011-08-31 At extremely low temperatures clouds of bosonic atoms form what is known as a Bose Einstein condensate Recently it has become clear that many different types of condensates so called fragmented condensates exist In order to tell whether fragmentation occurs or not it is necessary to solve the full many body Schrödinger equation a task that remained elusive for experimentally relevant conditions for many years In this thesis the first numerically exact solutions of the time dependent many body Schrödinger equation for a bosonic Josephson junction are provided and compared to the approximate Gross Pitaevskii and Bose Hubbard theories It is thereby shown that the dynamics of Bose Einstein condensates is far more intricate than one would anticipate based on these approximations A special conceptual innovation in this thesis are optimal lattice models It is shown how all quantum lattice models of condensed matter physics that are based on Wannier functions e g the Bose Fermi Hubbard model can be optimized variationally This leads to exciting new physics

Tunneling Dynamics in Open Ultracold Bosonic Systems Axel U. J. Lode, 2014-07-22 This thesis addresses the intriguing topic of the quantum tunnelling of many body systems such as Bose Einstein condensates Despite the enormous amount of work on the tunneling of a single particle through a barrier we know very little about how a system made of several or of many particles tunnels through a barrier to open space The present work uses numerically exact solutions of the time dependent many boson Schrödinger equation to explore the rich physics of the tunneling to open space process in ultracold bosonic particles that are initially prepared as a Bose Einstein condensate and subsequently allowed to tunnel through a barrier to open space The many body process is built up from concurrently occurring single particle processes that are characterized by different momenta These momenta correspond to the chemical potentials of systems with decreasing particle number The many boson process exhibits exciting collective phenomena the escaping particles fragment and lose their coherence with the source and among each other whilst correlations build up within the system The detailed understanding of the many body process is used to devise and test a scheme to control the final state momentum distributions and even the correlation dynamics of the

Equations in Nonlinear Systems Wu-Ming Liu, Emmanuel Kengne, 2019-03-20 This book explores the diverse types of Schrödinger equations that appear in nonlinear systems in general with a specific focus on nonlinear transmission networks and Bose Einstein Condensates In the context of nonlinear transmission networks it employs various methods to rigorously model the phenomena of modulated matter wave propagation in the network leading to nonlinear Schrödinger NLS equations Modeling these phenomena is largely based on the reductive perturbation method and the derived NLS equations are then used to methodically investigate the dynamics of matter wave solitons in the network In the context of Bose Einstein condensates BECs the book analyzes the dynamical properties of NLS equations with the external potential of different types which govern the dynamics of modulated matter waves in BECs with either two body interactions or both two and three body interatomic interactions It also discusses the method of investigating both the well posedness and the ill posedness of the boundary problem for linear and nonlinear Schrödinger equations and presents new results Using simple examples it then illustrates the results on the boundary problems For both nonlinear transmission networks and Bose Einstein condensates the results obtained are supplemented by numerical calculations and presented as figures **New Trends in**

One-Dimensional Bose Gases Tim Langen, 2015-05-22 This work presents a series of experiments with ultracold one dimensional Bose gases which establish said gases as an ideal model system for exploring a wide range of non equilibrium phenomena With the help of newly developed tools like full distributions functions and phase correlation functions the book reveals the emergence of thermal like transient states the light cone like emergence of thermal correlations and the

observation of generalized thermodynamic ensembles This points to a natural emergence of classical statistical properties from the microscopic unitary quantum evolution and lays the groundwork for a universal framework of non equilibrium physics The thesis investigates a central question that is highly contested in quantum physics how and to which extent does an isolated quantum many body system relax This question arises in many diverse areas of physics and many of the open problems appear at vastly different energy time and length scales ranging from high energy physics and cosmology to condensed matter and quantum information A key challenge in attempting to answer this question is the scarcity of quantum many body systems that are both well isolated from the environment and accessible for experimental study *High*

Conical Intersections in Physics Jonas Larson, Erik Sjöqvist, Patrik Öhberg, 2020-01-31 This concise book introduces and discusses the basic theory of conical intersections with applications in atomic molecular and condensed matter physics Conical intersections are linked to the energy of quantum systems They can occur in any physical system characterized by both slow and fast degrees of freedom such as e.g. the fast electrons and slow nuclei of a vibrating and rotating molecule and are important when studying the evolution of quantum systems controlled by classical parameters Furthermore they play a relevant role for understanding the topological properties of condensed matter systems Conical intersections are associated with many interesting features such as a breakdown of the Born Oppenheimer approximation and the appearance of nontrivial artificial gauge structures similar to the Aharonov-Bohm effect Some applications presented in this book include Molecular Systems some molecules in nonlinear nuclear configurations undergo Jahn-Teller distortions under which the molecule lowers their symmetry if the electronic states belong to a degenerate irreducible representation of the molecular point group Solid State Physics different types of Berry phases associated with conical intersections can be used to detect topologically nontrivial states of matter such as topological insulators Weyl semimetals as well as Majorana fermions in superconductors Cold Atoms the motion of cold atoms in slowly varying inhomogeneous laser fields is governed by artificial gauge fields that arise when averaging over the fast internal degrees of freedom of the atoms These gauge fields can be Abelian or non-Abelian which opens up the possibility to create analogs to various relativistic effects at low speed

Interferometry with Interacting Bose-Einstein Condensates in a Double-Well Potential Tarik Berrada, 2015-12-17 This thesis demonstrates a full Mach-Zehnder interferometer with interacting Bose-Einstein condensates confined on an atom chip It relies on the coherent manipulation of atoms trapped in a magnetic double-well potential for which the author developed a novel type of beam splitter Particle-wave duality enables the construction of interferometers for matter waves which complement optical interferometers in precision measurement devices both for

technological applications and fundamental tests This requires the development of atom optics analogues to beam splitters phase shifters and recombiners Particle interactions in the Bose Einstein condensate lead to a nonlinearity absent in photon optics This is exploited to generate a non classical state with reduced atom number fluctuations inside the interferometer This state is then used to study the interaction induced dephasing of the quantum superposition The resulting coherence times are found to be a factor of three longer than expected for coherent states highlighting the potential of entanglement as a resource for quantum enhanced metrology *Many-Particle Entanglement, Einstein-Podolsky-Rosen Steering and Bell Correlations in Bose-Einstein Condensates* Matteo Fadel, 2021-10-04 This book presents theoretical methods and experimental results on the study of multipartite quantum correlations in spin squeezed Bose Einstein condensates Nonclassical correlations in many body systems are particularly interesting for both fundamental research and practical applications For their investigation ultracold atomic ensembles offer an ideal platform due to their high controllability and long coherence times In particular we introduce criteria for detecting and characterizing multipartite entanglement Einstein Podolsky Rosen steering and Bell correlations Moreover we present the experimental observation of such correlations in systems of about 600 atoms
