Map Projections L M Bugayevskiy, John Snyder, 1995-06-28 Map projection concerns the science of mathematical cartography the techniques by which the Earth's dimensions shape and features are translated in map form be that two dimensional paper or two or three dimensional electronic representations The central focus of this book is on the theory of map projections Mathematical cartography also takes in map scales and their variation the division of maps into sets of sheets and nomenclature and addresses the problems of making measurements and conducting investigations which make use of geodetic measurements and the development of graphical methods for solving problems of spherical trigonometry marine and aeronavigation astronomy and even crystallography Map Projections--a Working Manual John Parr Snyder, 1987 Supersedes USGS Bulletin 1532 **Map Projections** John Parr Snyder, 1987 Map Projections--a Working Manual John Parr Snyder, 1987 Under each of the projections described the nonmathematical phases are presented first without interruption by formulas They are followed by the formulas and tables Even with the mathematics there are almost no derivations and very little calculus The emphasis is on describing the characteristics of the projection and how it is used

Portraits of the Earth Timothy G. Feeman,2002 Every map is a tool a product of human effort and creativity that represents some aspects of our world or universe This course was powered by the belief that by exploring the mathematical ideas involved in creating and analyzing maps students would see how mathematics could help them to understand and explain their world from the Preface Portraits of the Earth exemplifies the AMS s mission to bring the power and vitality of mathematical thought to the nonexpert It is designed to teach students to think logically and to analyze the technical information that they so readily encounter every day Maps are exciting visual tools that we encounter on a daily basis from street maps to maps of the world accompanying news stories to geologic maps depicting the underground structure of the

earth This book explores the mathematical ideas involved in creating and analyzing maps a topic that is rarely discussed in undergraduate courses It is the first modern book to present the famous problem of mapping the earth in a style that is highly readable and mathematically accessible to most students Feeman s writing is inviting to the novice yet also interesting to readers with more mathematical experience Through the visual context of maps and mapmaking students will see how contemporary mathematics can help them to understand and explain the world Topics explored are the shape and size of the earth basic spherical geometry and why one can t make a perfect flat map of the planet The author discusses different attributes that maps can have and determines mathematically how to design maps that have the desired features The distortions that arise in making world maps are quantitatively analyzed There is an in depth discussion on the design of numerous map projections both historical and contemporary as well as conformal and equal area maps Feeman looks at how basic map designs can be modified to produce maps with any center and he indicates how to generalize methods to produce maps of arbitrary surfaces of revolution Also included are end of chapter exercises and laboratory projects Particularly interesting is a chapter that explains how to use MapleR add on software to make maps from geographic data points This book would make an excellent text for a basic undergraduate mathematics or geography course and would be especially appealing to the teacher who is interested in exciting visual applications in the classroom It would also serve nicely as supplementary reading for a course in calculus linear algebra or differential geometry Prerequisites include a solid grasp of trigonometry and basic calculus R Waterloo Maple Inc Ontario Canada

A Cartographic Analysis of Soviet Military City Plans Martin Davis, 2021-09-29 The collapse of the Soviet Union has seen the emergence of its unprecedentedly comprehensive global secret military mapping project and the commercial availability of a vast number of detailed topographic maps and city plans at several scales This thesis provides an in depth examination of the series of over 2 000 large scale city plans produced in secret by the Military Topographic Directorate of the General Staff between the end of the Second World War and the collapse of the USSR in 1991 After positioning the series in its historical context the nature and

content of the plans are examined in detail A poststructuralist perspective introduces possibilities to utilise and apply the maps in new contexts which this thesis facilitates by providing a systematic empirical analysis of the Soviet map symbology at 1:10 000 and 1:25 000 using new translations of production manuals and a sample of the city plans A comparative analysis with the current OpenStreetMap symbology indicates scope for Soviet mapping to be used as a valuable supplementary topographic resource in a variety of existing and future global mapping initiatives including humanitarian crisis mapping This leads to a conclusion that the relevance and value of Soviet military maps endure in modern applications both as a source of data and as a means of overcoming contemporary cartographic challenges relating to symbology design and the handling of large datasets

Best Map Projections Elena Novikova, 2025-01-22 This book presents the most condensed information about the theory of distortion theory developed by N A Tissot It considers some of the issues of this theory to finding the best projections Various criteria for ideal projections are analyzed In finding an ideal projection using the Airy criterion for an arbitrary mapping region is solved by the variational method using the Euler Ostrogradsky system of equations under natural boundary conditions The same method is applied to a set of projections in which the sum of the extremal scale factors is equal to 2 It is shown that for these projections the area distortions are quantities of the second order of smallness while the linear distortions are quantities of the first order of smallness The problem of finding the best projections using the Chebyshev criterion has been studied Airy Postel Gauss Kruger and Markov projections are considered in detail
