Section 9.1 Reactions and Equations

pages 282–288

Practice Problems

pages 284–287

Write skeleton equations for the following word equations.

1. Hydrogen and bromine gases react to yield hydrogen bromide.

hydrogen(g) + bromine(g) →
hydrogen bromide(g)

2. When carbon monoxide and oxygen react, carbon dioxide forms.

carbon monoxide(g) + oxygen(g) →
carbon dioxide(g)

3. **Challenge** Write the word equation and the skeleton equation for the following reaction: when heated, solid potassium chlorate yields solid potassium chloride and oxygen gas.

potassium chlorate(s) →
potassium chloride(s) + oxygen(g)

Write chemical equations for each of the following reactions.

4. In water, iron(III) chloride reacts with sodium hydroxide, producing solid iron(III) hydroxide and sodium chloride.

5. Liquid carbon disulfide reacts with oxygen gas, producing carbon dioxide gas and sulfur dioxide gas.

6. **Challenge** A piece of zinc metal is added to a solution of hydrogen sulfate. This reaction produces a gas and a solution of zinc sulfate.

Section 9.1 Assessment

page 288

7. **Explain** why it is important that a chemical equation be balanced.

Because mass is neither created nor destroyed in chemical reactions, the numbers of atoms of all elements must be equal on both sides of the reaction arrow.

8. **List** three types of physical evidence that indicate a chemical reaction has occurred.

Answers may include release or absorption of energy, change in color, change in odor, formation of a gas, or formation of a solid.

9. **Compare and contrast** a skeleton equation and a chemical equation.

The skeleton equation includes the formulas of reactants and products. The chemical equation gives the relative amounts of reactants and products.

10. **Explain** why it is important to reduce coefficients in a balanced equation to the lowest possible whole-number ratio.

Coefficients in the lowest ratio most clearly indicate the relative amounts of substances in a reaction.

11. **Analyze** When balancing a chemical equation, can you adjust the subscript in a formula? Explain.

No. Doing so changes the identity of the substance.

Transition States of Biochemical Processes R. Gandour, 2013-06-29 The transition state theory has been from the point of its inception the most influential principle in the development of our knowledge of reaction mechanisms in solution It is natural that as the field of biochemical dynamics has achieved new levels of refinement its students have increasingly adopted the concepts and methods of transition state theory Indeed every dynamical problem of biochemistry finds its most elegant and economical statement in the terms of this theory Enzyme catalytic power for example derives from the interaction of enzyme and substrate structures in the transition state so that an understanding of this power must grow from a knowledge of these structures and interactions Similarly transition state interactions and the way in which they change as protein structure is altered constitute the pivotal feature upon which molecular evolution must turn The complete coupled dynamical system of the organism incorporating the transport of matter and energy as well as local chemical processes will eventually have to yield to a description of its component transition state structures and their energetic response characteristics even if the form of the description goes beyond present day transition state theory Finally the importance of biochemical effectors in medicine and agriculture carries the subject into the world of practical affairs in the use of transition state information for the construction of ultra potent biological agents
