Grid Computing Fran Berman, Geoffrey Fox, Anthony J. G. Hey, 2003-04-18 Grid computing is applying the resources of many computers in a network to a single problem at the same time Grid computing appears to be a promising trend for three reasons 1 Its ability to make more cost effective use of a given amount of computer resources 2 As a way to solve problems that can't be approached without an enormous amount of computing power 3 Because it suggests that the resources of many computers can be cooperatively and perhaps synergistically harnessed and managed as a collaboration toward a common objective A number of corporations professional groups university consortiums and other groups have developed or are developing frameworks and software for managing grid computing projects The European Community EU is sponsoring a project for a grid for high energy physics earth observation and biology applications In the United States the National Technology Grid is prototyping a computational grid for infrastructure and an access grid for people Sun Microsystems offers Grid Engine software Described as a distributed resource management tool Grid Engine allows engineers at companies like Sony and Synopsys to pool the computer cycles on up to 80 workstations at a time the Grid is a very hot topic generating broad interest from research and industry e.g. IBM Platform Avaki Entropia Sun HP Grid architecture enables very popular e-Science projects like the Genome project which demand global interaction and networking In recent surveys over 50% of Chief Information Officers are expected to use Grid technology this year Grid Computing Features contributions from the major players in the field Covers all aspects of grid technology from motivation to applications Provides an extensive state of the art guide in grid computing This is essential reading for researchers in Computing and Engineering physicists statisticians engineers and mathematicians and IT policy makers

Grid Computing: The New Frontier of High Performance Computing Lucio Grandinetti, 2005-11-15 The book deals with the most recent technology of distributed computing As Internet continues to grow and provide practical connectivity between users of computers it has become possible to consider use of computing resources which are far apart and connected by Wide Area Networks Instead of using only local computing power it has become practical to access computing resources widely distributed In some cases between different countries in other cases between different continents This idea of using computer power is similar to the well known electric power utility technology Hence the name of this distributed computing technology is the Grid Computing Initially grid computing was used by technologically advanced scientific users They used grid computing to experiment with large scale problems which required high performance computing facilities and

collaborative work In the next stage of development the grid computing technology has become effective and economically attractive for large and medium size commercial companies It is expected that eventually the grid computing style of providing computing power will become universal reaching every user in industry and business Written by academic and industrial experts who have developed or used grid computing Many proposed solutions have been tested in real life applications Covers most essential and technically relevant issues in grid computing *Ant Colony Optimization Algorithm for Load Balancing in Grid Computing (UUM Press)* Ku Ruhana Ku Mahamud, Aniza Mohamed Din, 2012-01-01 Managing resources in grid computing system is complicated due to the distributed and heterogeneous nature of the resources This research proposes an enhancement of the ant colony optimization algorithm that caters for dynamic scheduling and load balancing in the grid computing system The proposed algorithm is known as the enhance Ant Colony Optimization EACO The algorithm consists of three new mechanisms that organize the work of an ant colony i e initial pheromone value mechanism resource selection mechanism and pheromone update mechanism The resource allocation problem is modelled as a graph that can be used by the ant to deliver its pheromone This graph consists of four types of vertices which are job requirement resource and capacity that are used in constructing the grid resource management element The proposed EACO algorithm takes into consideration the capacity of resources and the characteristics of jobs in determining the best resource to process a job EACO selects the resources based on the pheromone value on each resource which is recorded in a matrix form The initial pheromone value of each resource for each job is calculated based on the estimated transmission time and execution time of a given job Resources with high pheromone value are selected to process the submitted jobs Global pheromone update is performed after the completion of processing the jobs in order to reduce the pheromone value of resources A simulation environment was developed using Java programming to test the performance of the proposed EACO algorithm against other ant based algorithm in terms of resource utilization Experimental results show that EACO produced better grid resource management solution Parallel Computing Roman Trobec, Marián Vajteršic, Peter Zinterhof, 2009-06-18 The use of parallel programming and architectures is essential for simulating and solving problems in modern computational practice There has been rapid progress in microprocessor architecture interconnection technology and software development which are increasing directly the rapid growth of parallel and distributed computing However in order to make these benefits usable in practice this development must be accompanied by progress in the design analysis and application aspects of parallel algorithms In particular new approaches from parallel numerics are important for solving complex computational problems on parallel and or distributed systems The contributions to this book are focused on topics most concerned in the trends of today's parallel computing These range from parallel algorithmics programming tools network computing to future parallel computing Particular attention is paid to parallel numerics linear algebra differential equations numerical integration number theory and their applications in computer simulations which together form the kernel of the monograph We expect that the

Modern Methods in Scientific Computing and Applications Anne Bourlioux, Martin Gander, 2012-12-06 When we first heard in the spring of 2000 that the Seminaire de mathematiques superieures SMS was interested in devoting its session of the summer of 2001 its 40th to scientific computing the idea of taking on the organizational work seemed to us somewhat remote More immediate things were on our minds one of us was about to go on leave to the Courant Institute the other preparing for a research summer in Paris But the more we learned about the possibilities of such a seminar the support for the organization and also the great history of the SMS the more we grew attached to the project The topics we planned to cover were intended to span a wide range of theoretical and practical tools for solving problems in image processing thin films mathematical finance electrical engineering moving

interfaces and combustion These applications alone show how wide the influence of scientific computing has become over the last two decades almost any area of science and engineering is greatly influenced by simulations and the SMS workshop in this field came very timely We decided to organize the workshop in pairs of speakers for each of the eight topics we had chosen and we invited the leading experts worldwide in these fields We were very fortunate that every speaker we invited accepted to come so the program could be realized as planned

Grid Resource Management Mumtaz Siddiqui, Thomas Fahringer, 2010-01-30 In a dynamic computing environment such as the Grid resource management plays a crucial role for making distributed resources available on demand to anyone from anywhere at any time without undermining the resource autonomy this becomes an art when dealing with heterogeneous resources distributed under multiple trust domains spanning across the Internet Today Grid execution environments provide abstract workflow descriptions that need a dynamic mapping to actual deployments this further accentuates the importance of resource management in the Grid This monograph renders boundaries of the Grid resource management identifies research challenges and proposes new solutions with innovative techniques for on demand provisioning automatic deployments dynamic synthesis negotiation based advance reservation and capacity planning of Grid resources The Grid capacity planning is performed with multi constrained optimized resource allocations by modelling resource allocation as an on line strip packing problem and introducing a new solution that optimizes resource utilization and QoS while generating contention free solutions On demand resource provisioning becomes possible by simplifying abstract resource descriptions independent from the concrete installations The book further explains the use of the semantic web technologies in the Grid to specify explicit definitions and unambiguous machine interpretable resource descriptions for intelligent resource matching and synthesis the synthesis process generates new compound resources with aggregated capabilities and prowess The newly introduced techniques have been developed and integrated in ASKALON Grid application development and runtime environment deployed in the Austrian Grid and demonstrated through well performed experiments
