

## CONDENSATE MECHANICS

Condensate forms in air conditioning systems and industrial processes and is a byproduct of various chemical reactions. Efficient removal of this condensate is crucial for maintaining system performance and preventing damage.

Condensate is typically collected in a reservoir or sump and then pumped out of the system. The pump must be capable of handling the volume of condensate and the height of the discharge. Proper pump selection and installation are essential for efficient condensate removal. Regular maintenance, including pump inspection and cleaning, is necessary to ensure reliable operation.

### Water Removal System

This type of system is used to remove water from a process stream. It typically consists of a series of stages, each with a water removal unit. The units are connected in series, and the process stream flows through them sequentially.

- Each stage typically consists of a water removal unit, a pump, and a control system. The units are connected in series, and the process stream flows through them sequentially.
- The control system monitors the water removal process and adjusts the pump flow rate to maintain the desired level of water removal.

This type of system is used to remove water from a process stream. It typically consists of a series of stages, each with a water removal unit. The units are connected in series, and the process stream flows through them sequentially.
