Implications of Immune Landscape in Tumor Microenvironment Selvarangan Ponnazhagan, Juana Serrano Lopez, Somchai Chutipongtanate, 2024-10-01 Tumor microenvironment TME plays an important role in immunosuppressive mechanisms that result in immune editing and treatment resistance Elucidating the diversity of stromal and immune cell distribution polarization and changes in their gene expression signatures will enable a better understanding of key events to improve treatment and prognosis With the onset of immune checkpoint inhibitors ICIs in clinics for patients with solid tumors and hematologic malignancies immunotherapy has taken a new direction in cancer management especially as combination therapies However limitations encountered with the use of ICIs including toxicity and immune related adverse events irAE indicate the need to understand multiple regulatory mechanisms at both cellular and molecular levels that alter the immune landscape of the TME Since predominant changes in the immune landscape occur at the TME focussed deliberation on these events will provide a comprehensive understanding on this topic for scientists in the fields of basic translational and clinical cancer immunology The heterogeneity of TME and complex immune landscape pose major challenges in the treatment of solid tumors Thus integrative approaches which relate immune mechanisms in the TME to that of peripheral and systemic immune signatures are essential to improve our understanding of the disease complexity and possibly improve immunotherapy outcomes Such multiparametric studies should combine advances in current understanding of cancer immunobiology with powerful technologies such as single cell and spatial transcriptomics and high dimensional flow cytometry that rapidly expand our ability to explore these interactions Notably tumor heterogeneity and inflammatory mediators in the TME vary significantly in neoplasms based on mutational load lymphocyte infiltration expression of checkpoint molecules soluble inhibitors and tumor cell metabolism Overall connecting key events to immune signatures that conform to a consensus will provide a benchmark to delve further into this important topic Other parameters such as myeloid and lymphoid cell polarization to alter the immune homeostasis at the TME favoring a tumor supportive milieu would provide a macroscopic picture that may help guide treatment choices for more refined personalized tumor immunotherapy
