Biodegradable Poly (hydroxyalkanoates) Qi Liao, 2010 Plastic materials have a huge impact to the environment EPA statistics shows that less than 7% of the plastic products are being recycled and many of the rest are sent to landfills or in worse scenarios end up in our natural environment Poly hydroxyalkanoates PHAs a family of biodegradable polyesters that can be produced by microbes fed on renewable carbon substrates can be used as a green substitute to conventional plastics and help solve this environmental problem However difficulties remain for using PHAs at a sizable scale Besides the high production cost weaknesses in material properties including narrow thermal processing window and insufficient melt elasticity are also limiting the application of PHAs Recent progress in PHA syntheses

has resulted in new copolymers in the PHA family which are expected to possess improved properties. In this thesis the melt properties of a series of one such copolymer poly 3 hydroxybutyrate co 3 hydroxyhexanoate P3HB co 3HHx with varying 3HHx content were investigated. Results suggested that the presence of the propyl side groups on 3HHx increases the steric hindrance of the P3HB co 3HHx chains thus resulting in increased entanglement density and subsequently the melt elasticity. Solid state properties of P3HB co 3HHx were also studied and the effects on biodegradability of thin films of P3HB co 3HHx were investigated. Results show that varying copolymer composition in combination with modifying the crystalline morphology through heat treatment may enable control over biodegradation rates for PHAs materials. In addition biodegradable cellular foams made of PHAs were synthesized through extrusion foaming a standard melt processing for thermoplastics. A commercial PHA copolymer poly 3 hydroxybutyrate co 3 hydroxyvalerate P3HB co 3HV was used and evaluated for its foamability. Another naturally derived polymer cellulose acetate butyrate CAB was chosen to blend with P3HB co 3HV to enhance its melt properties and processability. It was found that blending significantly improved the thermal processing window and enhanced melt elasticity. Results showed that selectively combining two types of bio based renewable polymer could be an effective way to tune the melt properties and crystallinity and thus the processability.

Perspectives on Tannins Andrzej Szczurek, 2021-08-30 Tannins are a family of versatile natural phenolic biomolecules whose key role is to protect plants against insects and fungi. They are also valuable in use for humans. We show tannins antioxidant and antibacterial properties in addition to their potential application in the food industry. We prove the accessibility of condensed tannins to a wide range of potential applications including NH₃ neutralizer the building block of numerous porous materials such as foams organic and carbon gels. Finally they are known as wood adhesives heavy metal scavengers and corrosion inhibitors. With this book we want to present the most promising perspectives of tannin.
