## **Mapping The Deep The Extraordinary Story Of Ocean Science:**

Mapping the Deep Robert Kunzig, 2000 The scientific exploration of the ocean is an extraordinary story Hundreds have climbed Everest yet only two people have descended in a homespun bathyscaphe to the very depths of the deepest sea chasm Amazing oases teeming with life have been found in deep sea volcanic vents but we have hardly begun to identify their resident species We know that sea currents control our climate but we don't know how Ocean scientists are pretty sure that we could reverse the greenhouse effect by manipulating plankton blooms with doses of iron but fear we might trigger an ice age in the act Mapping the Deep is a state of the ocean report on the sea and its science After amazing you at how little you know of the ocean Kunzig swiftly draws you into a compelling narrative of oceanographers past and present scientists pioneers maverick thinkers deep water divers and submersible pilots Like all the best science books this is a hugely informative page turner that confirms Robert Kunzig's position in the top rank of popular science writers

Mapping the Deep Robert Kunzig, 2012-05-28 A vivid tour of the Earth's last frontier a remote and mysterious realm that nonetheless lies close to the heart of even the most landlocked reader The sea covers seven tenths of the Earth but we have mapped only a small percentage of it The sea contains millions of species of animals and plants but we have identified only a few thousand of them The sea controls our planet's climate but we do not really understand how The sea is still the frontier and yet it seems so familiar that we sometimes forget how little we know about it Just as we are poised on the verge of exploiting the sea on an unprecedented scale mining it fertilizing it fishing it out this book reminds us of how much we have yet to learn More than that it chronicles the knowledge explosion that has transformed our view of the sea in just the past few decades and made it a far more interesting and accessible place From the Big Bang to that far off future time two billion years from now when our planet will be a waterless rock from the lush crowds of life at seafloor hot springs to the invisible jewel-like plants that float at the sea surface from the restless shifting of the tectonic plates to the majestic sweep of the ocean currents Kunzig's clear and lyrical prose transports us to the ends of the Earth Originally published in hardcover as *The Restless Sea*

Venturing the Deep Sea Laurie Lindop, 2006-01-01 Meet several scientists who study the animals and environment at the bottom of the ocean floor

**The Dance of Air and Sea** Arnold H. Taylor, 2011-02-24 How can the tiny plankton in the sea just off Western Europe be affected by changes 6000 km away on the other side of the North Atlantic Ocean How can a slight rise in the temperature of the surface of the Pacific Ocean have a devastating impact on amphibian life in Costa Rica Living populations across the globe are connected by great swayings of the world's atmosphere and oceans the largest of which is El Niño For almost half a century the numbers of some of the smallest animals in the North Sea have gone up and down as the Gulf Stream has moved north and south 4000 miles away at the coast of the USA This connection has happened because the weather patterns over the North Atlantic are intertwined by a phenomenon first described by a Danish missionary in the eighteenth century the North Atlantic Oscillation In *The Dance of Air and Sea* Arnold Taylor focuses on the large scale

dynamics of the world's climate looking at how the atmosphere and oceans interact and the ways in which ecosystems in water and on land respond to changes in weather. He tells stories of how discoveries were made and the scientists who made them and he considers the crucial issues of how the discoveries aid our response to global warming. **Encyclopedia of**

**Modern Coral Reefs** David Hopley, 2010-11-26 Coral reefs are the largest landforms built by plants and animals. Their study therefore incorporates a wide range of disciplines. This encyclopedia approaches coral reefs from an earth science perspective concentrating especially on modern reefs. Currently coral reefs are under high stress most prominently from climate change with changes to water temperature, sea level and ocean acidification particularly damaging. Modern reefs have evolved through the massive environmental changes of the Quaternary with long periods of exposure during glacially lowered sea level periods and short periods of interglacial growth. The entries in this encyclopedia condense the large amount of work carried out since Charles Darwin first attempted to understand reef evolution. Leading authorities from many countries have contributed to the entries covering areas of geology, geography and ecology providing comprehensive access to the most up to date research on the structure, form and processes operating on Quaternary coral reefs. **Becoming a**

**Marine Biologist** Virginia Morell, 2019-04-02 A fascinating guide to a career in marine biology written by bestselling journalist Virginia Morell and based on the real life experiences of an expert in the field. Essential reading for someone considering a path to this profession. His life may seem an impossible dream but his career path from being the first person in his family to graduate college to becoming the leading expert on some of Hawaii's marine mammals was full of twists and turns. Join Baird aboard his Zodiac for a candid look at the realities of life as a research scientist from the ever present struggles to secure grants and publish new data to the joys of helping to protect the ocean and its inhabitants. You'll also learn pro tips like the unexpected upsides to not majoring in marine biology and the usefulness of hobbies like sailing, birdwatching, photography and archery. You'll need good aim to tag animals with the tiny recording devices that track their movements. *Becoming a Marine Biologist* is an essential guide for anyone looking to turn a passion for the natural world into a career. This is the most valuable informational interview you'll have required reading for anyone considering this challenging yet rewarding path. *Oceans: A Very Short Introduction* Dorrik Stow, 2018-01-25

The importance of the oceans to life on Earth cannot be overstated. Liquid water covers more than 70% of our planet's surface and in past geological time has spread over 85%. Life on Earth began in the oceans over 3.5 billion years ago and remained there for the great majority of that time. Today the seas still provide 99% of habitable living space, the largest repository of biomass and holds the greatest number of undiscovered species on the planet. Our oceans are vital for the regulation of climate and with global warming and decreasing land area they have become increasingly important as the source of food energy in the form of oil and gas and for

their mineral wealth Oceans also form a key part of the biogeochemical cycles of carbon nitrogen and other elements critical to life Nutrients in upwelling areas are spread by ocean currents and the plankton of the seas supports a wealth of wildlife In this Very Short Introduction Dorrik Stow analyses these most important components of our blue planet and considers their relationship with and exploitation by humans He shows how the oceans are an essential resource to our overpopulated world and discusses why exploration and greater scientific understanding of the oceans their chemistry and their mineral wealth are now a high priority Stow also explores what we know of how oceans originate and evolve and change the shape of the seafloor and nature of its cover the physical processes that stir the waters and mix such a rich chemical broth and the inseparable link between oceans and climate As polar ice melts and sea levels rise countless millions who have made their homes on low lying lands close to the sea are threatened As scientific exploration of the seas gathers pace the new knowledge gained of the ocean Earth systems and their interaction with the human environment is vital to our understanding of how we can preserve these ultimately fragile environments ABOUT THE SERIES The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area These pocket sized books are the perfect way to get ahead in a new subject quickly Our expert authors combine facts analysis perspective new ideas and enthusiasm to make interesting and challenging topics highly readable

**Understand Science: Teach Yourself** Jon Evans, 2011-05-28

Science is a vast subject and our understanding of the way the world works is growing all the time No book could hope to include everythingt that science has discovered but this book includes all of the essential facts about all the really key areas Broken down into short easy to digest sections it covers everything from evolution and cell biology to star formation and plate tectonics Including sections on what technology may allow us to do in the future and even looking at when science has gone bad Understand Science will change the way you see the world around you

**The Geography of the Ocean**

Anne-Flore Laloë, 2016-04-14 Despite the fact that the vast majority of the earth s surface is made up of oceans there has been surprisingly little work by geographers which critically examines the ocean space and our knowledge and perceptions of it This book employs a broad conceptual and methodological framework to analyse specific events that have contributed to the production of geographical knowledge about the ocean These include but are not limited to Christopher Columbus first transatlantic journey the mapping of nonexistent islands the establishment of transoceanic trade routes the discovery of largescale water movements the HMS Challenger expedition the search for the elusive Terra Australis Incognita the formulation of the theory of continental drift and the mapping of the seabed Using a combination of original empirical archival material and cartographic and theoretical sources this book uniquely brings together fascinating narratives throughout history to produce a representation and mapping of geographical oceanic knowledge It questions how we know what we know about the oceans and how this knowledge is represented and mapped The book then uses this representation and mapping as a way to coherently trace the evolution of oceanic spatial awareness In recent years particularly in historical

geography discovering and knowing the ocean space has been a completely separate enterprise from discovering and colonising the lands beyond it There has been such focus on studying colonised lands yet the oceans between them have been neglected This book gives the geographical ocean a voice to be acknowledged as a space where history geography and indeed historical geography took place *Ocean Worlds* Jan Zalasiewicz, Mark Williams, 2014-10-23 Oceans make up most of the surface of our blue planet They may form just a sliver on the outside of the Earth but they are very important not only in hosting life including the fish and other animals on which many humans depend but in terms of their role in the Earth system in regulating climate and cycling nutrients As climate change pollution and over exploitation by humans puts this precious resource at risk it is more important than ever that we understand and appreciate the nature and history of oceans There is much we still do not know about the story of the Earth's oceans and we are only just beginning to find indications of oceans on other planets In this book geologists Jan Zalasiewicz and Mark Williams consider the deep history of oceans how and when they may have formed on the young Earth topics of intense current research how they became salty and how they evolved through Earth history We learn how oceans have formed and disappeared over millions of years how the sea nurtured life and what may become of our oceans in the future We encounter some of the scientists and adventurers whose efforts led to our present understanding of oceans And we look at clues to possible seas that may once have covered parts of Mars and Venus that may still exist below the surface on moons such as Europa and Callisto and the possibility of watery planets in other star systems **The High Seas** Olive Heffernan, 2024-05-21 In this essential guide to the half of our blue planet we call the high seas Will McCallum author of *How to Give Up Plastic* one of the world's leading voices on the issue tracks the race to exploit and protect our last frontier Two thirds of the world's oceans lie beyond national borders Owned by all nations and no nation simultaneously the high seas are home to some of the richest and most biodiverse environments on the planet But they are also home to exploitation on a scale that few of us have imagined Here out of sight and out of mind industry and economic progress rule and lax enforcement and apathy are the status quo underscored by a battle to control profit from protect or obliterate the world's largest wildest commons In this book Heffernan uncovers the truth behind deeply exploitative fishing practices investigates the potentially devastating impact of deep sea mining and holds to task the Silicon Valley interventionists whose solutions to climate change are often wildly optimistic radically irresponsible or both This is a powerful and deeply researched manifesto calling for the protection and preservation of this final frontier Published in Partnership with the David Suzuki Institute *Hot Carbon* John F. Marra, 2019-06-25 There are few fields of science that carbon 14 has not touched A radioactive isotope of carbon it stands out for its unusually long half life Best known for its application to estimating the age of artifacts carbon dating carbon 14 helped reveal new chronologies of human civilization and geological time Everything containing carbon the basis of all life could be placed in time according to the clock of radioactive decay with research applications ranging from archeology to oceanography to climatology In *Hot Carbon* John F

Marra tells the untold story of this scientific revolution He weaves together the workings of the many disciplines that employ carbon 14 with gripping tales of the individuals who pioneered its possibilities He describes the concrete applications of carbon 14 to the study of all the stuff of life on earth from climate science s understanding of change over time to his own work on oceanic photosynthesis with microscopic phytoplankton Marra s engaging narrative encompasses nuclear testing the peopling of the Americas elephant poaching and the flax plants used for the linen in the Shroud of Turin Combining colorful narrative prose with accessible explanations of fundamental science *Hot Carbon* is a thought provoking exploration of how the power of carbon 14 informs our relationship to the past

**The Explorer Gene** Tom Cheshire,2013-12-03 The remarkable account of an extraordinary family of explorers who spurred innovation and accomplished incredible feats even when the popular consensus was against them On May 27 1931 Auguste Piccard became the first human to enter the stratosphere flying an experimental balloon he invented himself Thirty years later his son Jacques went to the bottom of the earth descending to the Mariana Trench in a submarine built by him and Auguste To this day no one has gone deeper Bertrand the third generation was the first person to fly around the world non stop in a balloon Now he s building his own craft a solar powered plane to circumnavigate the globe In *The Explorer Gene* Tom Cheshire asks how three generations of one family achieved such extraordinary feats often with the consensus against them None of the Piccards set out to explore Auguste was a physicist Jacques an economist and Bertrand a psychiatrist Was it fate a famous family name or their explorer gene

**Microbes Lethal to Mankind** Michael Manning,2014-12-27 Mankind is threatened by normal microbial life in 2014 crossing the species barrier from fruit bats to humans particularly when the Ebola virus disturbed by new roads entering primeval jungle and then overtaking human slums in Conakry Guinea Freetown Sierra Leone and in Monrovia Liberia This book documents the response to Ebola flu Bubonic plague and other pathogens Updated Ebola Viral Disease outbreak in DRC and Congo with crucial updates on Covid 19 2020 and the future of mankind

**Moby-Duck** Donovan Hohn,2011-03-03 Selected by The New York Times Book Review as a Notable Book of the Year A revelatory tale of science adventure and modern myth When the writer Donovan Hohn heard of the mysterious loss of thousands of bath toys at sea he figured he would interview a few

oceanographers talk to a few beachcombers and read up on Arctic science and geography But questions can be like ocean currents wade in too far and they carry you away Hohn's accidental odyssey pulls him into the secretive world of shipping conglomerates the daring work of Arctic researchers the lunatic risks of maverick sailors and the shadowy world of Chinese toy factories Moby Duck is a journey into the heart of the sea and an adventure through science myth the global economy and some of the worst weather imaginable With each new discovery Hohn learns of another loose thread and with each successive chase he comes closer to understanding where his castaway quarry comes from and where it goes In the grand tradition of Tony Horwitz and David Quammen Moby Duck is a compulsively readable narrative of whimsy and curiosity

**Sea Sick** Alanna Mitchell, 2011-05-18 All life whether on land or in the sea depends on the oceans for two things Oxygen Most of Earth's oxygen is produced by phytoplankton in the sea These humble one celled organisms rather than the spectacular rain forests are the true lungs of the planet Climate control Our climate is regulated by the ocean's currents winds and water cycle activity Sea Sick is the first book to examine the current state of the world's oceans the great unexamined ecological crisis of the planet and the fact that we are altering everything about them temperature salinity acidity ice cover volume circulation and of course the life within them Alanna Mitchell joins the crews of leading scientists in nine of the global ocean's hotspots to see firsthand what is really happening around the world Whether it's the impact of coral reef bleaching the puzzle of the oxygen less dead zones such as the one in the Gulf of Mexico or the shocking implications of the changing pH balance of the sea Mitchell explains the science behind the story to create an engaging accessible yet authoritative account

*Encyclopedia of Marine Science* C. Reid Nichols, Robert G. Williams, 2009 Presents an illustrated A-Z encyclopedia with more than 600 entries providing information on topics related to marine science

**The Planet in a Pebble** Jan Zalasiewicz, 2010-09-23 This is the story of a single pebble It is just a normal pebble as you might pick up on holiday on a beach in Wales say Its history though carries us into abyssal depths of time and across the farthest reaches of space This is a narrative of the Earth's long and dramatic history as gleaned from a single pebble It begins as the pebble particles form amid unimaginable violence in distal realms of the Universe in the Big Bang and in supernova explosions and continues amid the construction of the Solar System Jan Zalasiewicz shows the almost incredible complexity present in such a small and apparently mundane object Many events in the Earth's ancient past can be deciphered from a pebble volcanic eruptions the lives and deaths of extinct animals and plants the alien nature of long vanished oceans and transformations deep underground including the creations of fool's gold and of oil Zalasiewicz demonstrates how geologists reach deep into the Earth's past by forensic analysis of even the tiniest amounts of mineral matter Many stories are crammed into each and every pebble around us It may be small and ordinary this pebble but it is also an eloquent part of our Earth's extraordinary never ending story
