Palaeobiogeography of Marine Fossil Invertebrates Fabrizio Cecca, 2014-04-21 Sitting squarely at the interface between earth and life sciences palaeobiogeographic information is scattered throughout many publications Until now Palaeobiogeography of Marine Fossil Invertebrates covers important theoretical concepts relating to palaeobiogeography together with descriptions of analytical methods Fabrizio Cecca discusses general biogeographical concepts and the factors influencing distributional patterns using illustrative case histories Cecca uses the palaeobiogeography of fossil organisms to generate hypotheses on continental drifting past migration routes palaeobiodiversity gradients geographic barriers palaeoclimatic and paleoceanographic conditions He explores the biogeographical dimension of biodiversity through the analysis of existing latitudinal and longitudinal gradients of biodiversity and discusses the biodiversity area relationship with particular reference to sea level variations *Carbon Cycle and Ecosystem Response to the Jenkyns Event in the Early Toarcian (Jurassic)* M. Reolid, L.V. Duarte, E. Mattioli, W. Ruebsam, 2021-11-30 The Toarcian Oceanic Anoxic Event also known as the Jenkyns Event was a hyperthermal episode which occurred during the early Toarcian c 183 Ma Early Jurassic and resulted in numerous collateral effects including global warming enhanced weathering sea level change carbonate crisis marine anoxia dysoxia and a second order mass extinction This volume presents the latest advances for understanding early Toarcian environmental changes through different disciplines biostratigraphy micropalaeontology palaeontology ichnology

Kathleen Lyons,Anna K. Behrensmeyer,Peter J. Wagner,2019-12-13 Approximately 99% of all life that has ever existed is extinct Fortunately these long dead species have left traces of their lives and interactions with other species in the rock record that paleoecologists use to understand how species and ecosystems have changed over time This record of past life allows us to study the dynamic nature of the Earth and gives context to current and future ecological challenges This book brings together forty four classic papers published between 1924 and 1999 that trace the origins and development of paleoecology The articles cross taxonomic groups habitat types geographic areas and time and have made substantial contributions to our knowledge of the evolution of life Encompassing the full breadth of paleoecology the book is divided into six parts community and ecosystem dynamics community reconstruction diversity dynamics paleoenvironmental reconstruction species interaction and taphonomy Each paper is also introduced by a contemporary expert who gives context and explains its importance to ongoing paleoecological research A comprehensive introduction to the field Foundations of Paleoeecology will be an essential reference for new students and established paleoecologists alike Ecology of Marine Invertebrate Larvae Larry McEdward,2020-04-08 This is the first book to provide a detailed treatment of the field of larval ecology The 13 chapters use state of the art reviews and critiques of nearly all of the major topics in this diverse and rapidly growing field Topics include patterns of larval diversity reproductive energetics spawning ecology life history theory larval feeding and nutrition larval mortality behavior and locomotion larval transport dispersal population genetics recruitment dynamics and larval evolution Written by the leading new scientists in the field chapters define the current state of larval ecology and outline the important questions for future research **Recruitment, Colonization and Physical-Chemical Forcing in Marine Biological Systems** Susanne Baden,Leif Pihl,Rutger Rosenberg,Jarl-Ove Strömberg,Ib Svane,Peter Tiselius,2013-06-29 The 32nd European Marine Biology Symposium was held in Lysekil Sweden on August 16 22 1997 organised by Kristineberg Marine Research Station The selected topics were Recruitment and colonisation and Physical and Chemical Forcing on Marine Biological Systems partly reflecting the present research interests at Kristineberg In this volume recruitment and colonisation processes cover primarily the dynamics of interspecific interactions within assemblages as well as the effects of hydrodynamic variables Both laboratory and field studies are emphasised The contribution of papers within the topic Physical and Chemical Forcing on Marine Biological Systems deals with structuring effects of for example tides temperatures nutrients and hypoxia on the physiology and ecology of marine organisms The book covers many aspects of marine life It is our hope that the selected topics will fascinate readers and be of wide interest to students and researchers in marine biology Effects of Past Global Change on Life National Research Council,Division on Earth and Life

Dietl, Karl W. Flessa, 2017-11-17

In conservation perhaps no better example exists of the past informing the present than the return of the California condor to the Vermilion Cliffs of Arizona Extinct in the region for nearly one hundred years condors were successfully reintroduced starting in the 1990s in an effort informed by the fossil record condor skeletal remains had been found in the area's late Pleistocene cave deposits The potential benefits of applying such data to conservation initiatives are unquestionably great yet integrating the relevant disciplines has proven challenging Conservation Paleobiology gathers a remarkable array of scientists from Jeremy B C Jackson to Geerat J Vermeij to provide an authoritative overview of how paleobiology can inform both the management of threatened species and larger

conservation decisions Studying endangered species is difficult They are by definition rare some exist only in captivity and for those still in their native habitats any experimentation can potentially have a negative effect on survival Moreover a lack of long term data makes it challenging to anticipate biotic responses to environmental conditions that are outside of our immediate experience But in the fossil and prefossil records from natural accumulations such as reefs shell beds and caves to human made deposits like kitchen middens and archaeological sites enlightening parallels to the Anthropocene can be found that might serve as a primer for present day predicaments Offering both deep time and near time perspectives and exploring a range of ecological and evolutionary dynamics and taxa from terrestrial as well as aquatic habitats Conservation Paleobiology is a sterling demonstration of how the past can be used to manage for the future giving new hope for the creation and implementation of successful conservation programs

Integrating Conservation Biology and Paleobiology to Manage Biodiversity and Ecosystems in a Changing World G. Lynn Wingard,Chris Schneider,Gregory P. Dietl ,Damien Fordham, Policy makers and resource managers must make decisions that affect the resilience and sustainability of natural resources including biodiversity and ecosystem services However these decisions are often based on evidence or theory derived from highly altered systems and over short time periods of low magnitude environmental and climatic change Because natural systems change and evolve across multiple timescales from instantaneous to millennial long term understanding of how past life has responded to perturbations can inform resource managers By using these natural laboratories of the past conservation paleobiology and paleoecology provide the framework necessary to anticipate and plan for future changes The goal of this Research Topic is to heighten awareness among conservation and restoration practitioners to the value and applications of long term perspectives provided by conservation paleobiology and paleoecology Most conservation studies focus on systems already impacted by anthropogenic change these studies would benefit from paleontological data through expanded temporal scales identification of baselines and an understanding of how organisms have responded to past changes However resource management decisions rarely include input from paleontologists and paleoecological research is rarely incorporated into conservation decision making We seek to bridge this research implementation gap by highlighting the application of paleoecological data to issues such as biodiversity dynamics extinction risks and resilience to perturbations among other topics We hope to foster new cross disciplinary synergies by encouraging conservation scientists and managers to collaborate with paleontologists to improve conservation decision making and by increasing awareness among paleontologists to the needs of the resource management community This Research Topic will provide a forum for both the paleontological and resource management communities to exchange ideas that will enhance restoration and conservation decision making We invite papers on conceptual advances reviews of specific topics to guide efforts in research or practice case studies of successful applications articles describing datasets with applied value and perspective papers summarizing a body of paleontological research with relevance to the resource management community

Topics can include but are not limited to Responses of species communities and ecosystems to perturbations Strategies to achieve the direct integration of paleobiology and paleoecology into on ground resource management Identifying baselines and reference conditions Increasing the robustness of forecasting models through the incorporation of paleontological data Identifying key species interactions and other phenomena as indicators of impending change New methodologies analytical tools and or proxies in the application of paleontological data to conservation and restoration practice Lynn Wingard Damien Fordham and Greg Dietl have no conflicts of interest Chris Schneider has a potential conflict of interest where manuscripts pertain to stakeholders in the petroleum industry as she is an independent contractor in the Alberta Oil Sands mining area

Ecosystems of the Deep Oceans P.A. Tyler, 2003-03-27 This volume examines the deep sea ecosystem from a variety of perspectives The initial chapters examine the deep sea floor the deep pelagic environment and the more specialised chemosynthetic environments of hydrothermal vents and cold seeps These environments are examined from the perspective of the relationship of deep sea animals to their physico chemical environment Later chapters examine the biogeography of the main deep oceans Atlantic Pacific and Indian with particular attention to the downward flux of surface derived organic matter and how this drives the processes within the deep sea ecosystem The peripheral deep seas including the polar seas and the marginal deep seas inter alia the Mediterranean Red Caribbean and Okhotsk seas are explored in the same context The final chapters examine the processes occurring in the deep sea and include an analysis of why the deep sea has high species diversity how the fauna respond to organic input and how species have adapted reproductive activity in the deep sea The volume concludes with an analysis of the anthropogenic impact on the deep sea **The Geological Record of**

Ecological Dynamics National Research Council, Division on Earth and Life Studies, Board on Life Sciences, Board on Earth Sciences and Resources, Committee on the Geologic Record of Biosphere Dynamics, 2005-01-13 In order to answer important questions about ecosystems and biodiversity scientists can look to the past geological record which includes fossils sediment and ice cores and tree rings Because of recent advances in earth scientists ability to analyze biological and environmental information from geological data the National Science Foundation and the U S Geological Survey asked a National Research Council NRC committee to assess the scientific opportunities provided by the geologic record and recommend how scientists can take advantage of these opportunities for the nation s benefit The committee identified three initiatives for future research to be developed over the next decade 1 use the geological record as a natural laboratory to explore changes in living things under a range of past conditions 2 use the record to better predict the response of biological systems to climate change and 3 use geologic information to evaluate the effects of human and non human factors on ecosystems The committee also offered suggestions for improving the field through better training improved databases and additional funding
