Further genetic studies of some, nonrecombining selfing sites, and their association with recombining sites on the same chromosome suggest different evolutionary histories for the two sets of nuclear markers. The non-recombining markers indicate a different evolutionary history than the recombining markers. These results and some other studies in *Arabidopsis* and other plants may indicate that the two sets of nuclear markers are under different evolutionary pressures and therefore represent different aspects of evolution in *Arabidopsis* and other plants.

Further genetic studies are needed, since numerous self-pollinating *Alb.* and *Alba* genotypes will maintain transgressive or transgressive-like negative allelism over generations. We will focus on genetic markers, such as central transgressive allelismogenes *Albapap* and *Albapap2*, and *Albapap3* in *Alb.* genotypes.
