PLANT LIKE PROTOCTISTS: ALGAE (CHIORELLA AND ULVA):

Algae are responsible for more than half of the amount of photosynthesis being carried in the world. Algae ranges from unicellular to filamentous and to huge multicellular structure.

Chlorella:

Introduction:

It is plant like prototist and grows in fresh water and usually floats in stagnet water of ponds, pools, ditches etc. it is easily cultured.

Structure:

Chlorella is single celled, spherical and solitary. The cell is surrounded by cell wall. The body comprises of a single nucleus and cup shaped chloroplast. Pyrenoid is usually absent.

Reproduction:

Chlorella reproduces asexually by aplanospores. The protoplast divides into 8 to 16 daughter protoplast and develops a wall to produce non motile aplanospore. After maturation, the aplanospores are released from the parent body. Each aplanospore develops into a new chlorella.

Economic Importance:

- Chlorella cells have very high food value. They contain about 50% proteins, 20% fats and 20% carbohydrate, amino acids and vitamins, therefore considered as an alternative source of food.
- An antibiotic chlorellin is produced from chlorella which is useful for controlling bacterial diseases.
- Chlorella is an experimental organism in research of photosynthesis as it can be grown easily.
