High-Level Modeling and Synthesis of Analog Integrated Systems Ewout S. J. Martens, Georges Gielen, 2008-01-03 As the miniaturization of semiconductor technology continues electronic systems on chips offer a more extensive and more complex functionality with better performance higher frequencies and less power consumption Whereas digital designers can take full advantage of the availability of design automation tools to build huge systems the lack of support by computer programs for different abstraction levels makes analog design a time consuming handcraft which limits the possibilities to implement large systems Various approaches for finding optimal values for the parameters of analog cells like opamps have been investigated since the mid 1980s and they have made their entrance in commercial applications However a larger impact on the performance is expected if tools are developed which operate on a higher abstraction level and consider multiple architectural choices to realize a particular functionality In this book the opportunities conditions problems solutions and systematic methodologies for this new generation of analog CAD tools are examined

The outline of this book is as follows In the first part the characteristics of the analog design process are systematically analyzed and several approaches for automated analog synthesis are summarized Comparison of their properties with the requirements for high level synthesis of analog and mixed signal systems results in a new design paradigm the high level design flow based on generic behavior This design approach involves a modeling strategy using generic behavioral models and a synthesis strategy leading to the exploration of a heterogeneous design space containing different architectures The modeling strategy is further elaborated in Part II

Ultra Low Power Capacitive Sensor Interfaces Wouter Bracke, Robert Puaers, Chris Van Hoof, 2007-06-15 The increasing performance of smart microsystems merging sensors signal processing and wireless communication promises to have a pervasive impact during the coming decade These autonomous microsystems find applications in sport evaluation health care environmental monitoring and automotive systems They gather data from the

physical world convert them to electrical form compensate for interfering variables or non linearities and either act rectly on them or transfer it to other systems Most often these sensor systems are developed for a speci c application This approach leads to a high rec rent design cost A generic front end architecture where only the sensors and the microcontroller software are customized to the selected application would reduce the costs signi cantly This work presents a new generic architecture for autonomous sensor nodes The modular design methodology provides a exible way to build a complete sensor interface out of con gurable blocks The settings of these blocks can be optimized according to the varying needs of the application Furthermore the system can easily be expanded with new building blocks The modular system is illustrated in a Generic Sensor Interface Chip GSIC for capa tive sensors Many con guration settings adapt the interface to a broad range of applications The GSIC is optimized for ultra low power consumption It achieves an ON state current consumption of 40 A

Structured Analog CMOS Design Danica Stefanovic, Maher Kayal, 2008-10-20 Structured Analog CMOS Design describes a structured analog design approach that makes it possible to simplify complex analog design problems and develop a design strategy that can be used for the design of large number of analog cells It intentionally avoids treating the analog design as a mathematical problem developing a design procedure based on the understanding of device physics and approximations that give insight into parameter interdependences The basic design concept consists in analog cell partitioning into the basic analog structures and sizing of these basic analog structures in a predefined procedural design sequence The procedural design sequence ensures the correct propagation of design specifications the verification of parameter limits and the local optimization loops The proposed design procedure is also implemented as a CAD tool that follows this book

Circuit and Interconnect Design for RF and High Bit-rate Applications Hugo Veenstra, John R. Long, 2008-06-04 Realizing maximum performance from high bit rate and RF circuits requires close attention to IC technology circuit to circuit interconnections i e the interconnect and circuit design This detailed book covers each of these topics from theory to practice with sufficient detail to help you produce circuits that are first time right Many practical circuit examples are included to demonstrate the interplay between technology interconnect and circuit design

Low Power UWB CMOS Radar Sensors Hervé Paulino, Joao Goes, Adolfo Steiger Garção, 2008-05-02 Low Power UWB CMOS Radar Sensors deals with the problem of designing low cost CMOS radar sensors The radar sensor uses UWB signals in order to obtain a reasonable target separation capability while maintaining a maximum signal frequency below 2 GHz This maximum frequency value is well within the reach of current CMOS technologies The use of UWB signals means that most of the methodologies used in the design of circuits and systems that process narrow band signals can no longer be applied Low Power UWB CMOS Radar Sensors provides an analysis between the interaction of UWB signals the antennas and the processing circuits This analysis leads to some interesting conclusions on the types of antennas and types of circuits that should be used A methodology to compare the noise performance of UWB processing circuits is also derived This

methodology is used to analyze and design the constituting circuits of the radar transceiver In order to validate the design methodology a CMOS prototype is designed and experimentally evaluated
