Information Security reaches back to ancient times and starts with the emergence of bureaucracy in administration and warfare. Some aspects such as the interception of encrypted messages during World War II have attracted huge attention, whereas other aspects have remained largely uncovered. There has never been any effort to write a comprehensive history. This is most unfortunate because Information Security should be perceived as a set of communicating vessels where technical innovations can make existing legal or organisational frameworks obsolete and a breakdown of political authority may cause an exclusive reliance on technical means. This book is intended as a first field survey. It consists of twenty-eight contributions written by experts in such diverse fields as computer science, law, or history and political science, dealing with episodes, organisations, and technical developments that may be considered to be exemplary or have played a key role in the development of this field. These include the emergence of cryptology as a discipline during the Renaissance, the Black Chambers in 18th-century Europe, the breaking of German military codes during World War II, the histories of the NSA and its Soviet counterparts, and contemporary cryptology. Other subjects are computer security, standards, viruses, and worms on the Internet, computer transparency, and free software, computer crime, export regulations for encryption software, and the privacy debate. Interdisciplinary coverage of the history of Information Security. Written by top experts in law, history, computer, and information science. First comprehensive work in Information Security.

Handbook of Multimedia Information Security: Techniques and Applications Amit Kumar Singh, Anand Mohan, 2019-07-19. This handbook is organized under three major parts. The first part of this handbook deals with multimedia security for emerging applications. The chapters include basic concepts of multimedia tools and applications, biological and behavioral biometrics, effective multimedia encryption and secure watermarking techniques for emerging applications, an adaptive face identification approach for Android mobile devices, and multimedia using chaotic and perceptual hashing functions. The second part of this handbook focuses on multimedia processing for various potential applications. The chapter includes a detailed survey of image processing-based automated glaucoma detection techniques and the role of denoising, recent study of dictionary learning-based image reconstruction techniques for analyzing big medical data, brief introduction of quantum image processing and its applications, a segmentation-less efficient Alzheimer detection approach, object recognition, image enhancements, and denoising techniques for emerging applications, improved performance of image compression approach, and automated detection of eye-related diseases using digital image processing. The third part of this handbook introduces multimedia applications. The chapter includes an extensive survey on the role of multimedia in medicine and multimedia forensics, classification, a finger-based authentication system for e-health, security analysis of recently developed deep learning techniques for emotion and activity recognition. Further, the book introduces a case study on change of ECG according to time for user identification, role of multimedia in big data, cloud computing, the Internet of Things (IoT), and blockchain environment in detail for real-life applications. This handbook targets researchers, policy makers, programmers, and industry professionals.
