Robotics Goes MOOC Bruno Siciliano, 2025-06-08 It is often read in the media that AI and Robotics are the primary cause of technology unemployment AI and machine learning techniques are expected to take over lower level tasks while humans can spend more time with higher level tasks In perspective it can be said that jobs requiring boring cognitive tasks or repeatable and dangerous physical tasks will be considerably shredded by automation thanks to the wide adoption of AI Robotics technology to replace humans while jobs requiring challenging cognitive tasks or unstructured physical tasks will be suitably re engineered with the progressive introduction of AI Robotics technology to assist humans From the discussion above it should be clear that in a world populated by humans and robots issues arise that go beyond engineering and technology due to the impact resulting from the use of robots in various application scenarios The anthropization of robots cannot ignore the resolution of those ethical legal sociological economic ELSE problems that have so far slowed their spread in our society The

final book of the Robotics Goes MOOC project enlightens the impact of using robotic technology in the main fields of application namely industrial robots as in Chapter 1 by Bischoff et al medical robotics as in Chapter 2 by Dario et al aerial robots as in Chapter 3 by Ollero et al orbital robotics as in Chapter 4 by Lampariello underwater robots in Chapter 5 by Antonelli and rescue robots as in Chapter 6 by Murphy The last part is devoted to the open dilemma of using and accepting robots in human co habited environments which is addressed in Chapter 7 on social robotics by Pandey and the very final chapter by Tamburrini on the important issues raised with roboethics

Hoffman,Gareth E. Conway,Jan Maarten Schraagen,David Peebles,Robert J. B. Hutton,Erich J. Petushek,2018-02-28 The increasing complexity of work systems and changes in the nature of workplace technology over the past century have resulted in an exponential shift in the nature of work activities from physical labor to cognitive work Modern work systems have many characteristics that make them cognitively complex They can be highly interactive comprised of multiple agents and artifacts information may be limited and distributed across space and time task goals are frequently ill defined conflicting dynamic and emergent planning may only be possible at general levels of abstraction or require adaptive solutions some degree of proficiency or expertise is required the stakes are often high and uncertainty time constraints and stress are seldom absent To complicate matters further cognition in complex work settings is typically constrained by broader

professional organizational and institutional practice and policy These features of cognitive work present significant challenges to scientific methodology and theory and subsequent design of reliable interventions Historically philosophers and scientists have attempted to understand the mental activities experienced during cognitive work at multiple levels of analysis using divergent methods Some have examined cognition at an associative contextual functional or holistic level relying on naturalistic methods to understand the higher mental processes as they work in harmony during goal directed behavior Others have embraced experimental methods and favored internal over external validity often reducing cognition to a psychology of fundamental acts such as short term memory access with millisecond shifts in attention More recently Macro cognition has evolved as a complementary paradigm Macro cognitive researchers have studied the cognitive functions and processes associated with skilled adaptive collaborative and resilient cognitive work in the context of the aforementioned complexities of psychotechnical and sociotechnical work systems Typically this research has been carried out using cognitive task analytic techniques that draw on both naturalistic and quasi experimental methods The primary goals of research in Macro cognition are to better understand cognitive adaptations to complexity to increase our theoretical understanding of the organism environment relations by studying the mapping between cognitive work and real world demands and to promote use inspired research capable of improving system performance Automation 2019 Roman Szewczyk, Cezary

Zieliński, Małgorzata Kaliczyńska, 2019-02-15 This book consists of papers presented at AUTOMATION2019 an international conference held in Warsaw from March 27 to 29 2019 It discusses the radical technological changes occurring due to the INDUSTRY 4 0 To follow these changes both scientists and engineers have to face the challenge of interdisciplinary approach directed at the development of cyber physical systems This approach encompasses interdisciplinary theoretical knowledge numerical modelling and simulation as well as application of artificial intelligence techniques Both software and physical devices are composed into systems that will increase production efficiency and resource savings The theoretical results practical solutions and guidelines presented are valuable for both researchers working in the area of engineering sciences and practitioners looking for solutions to industrial problems **Advances in Engineering Design and Simulation**
