An Introduction to Geotechnical Processes John Woodward, 2005-03-10 The study of the solid part of the earth on which structures are built is an essential part of the training of a civil engineer Geotechnical processes such as drilling pumping and injection techniques enhance the viability of many construction processes by improving ground conditions Highlighting the ground investigation necessary for the process the likely improvement in strength of treated ground and testing methods An Introduction to Geotechnical Processes covers the elements of ground treatment and improvement from the control of groundwater drilling and grouting to ground anchors and electro chemical hardening

Fundamentals of Deep Excavations Chang-Yu Ou, 2021-10-25 Excavation is an important segment of foundation engineering e g in the construction of the foundations or basements of high rise buildings

underground oil tanks or subways However the excavation knowledge introduced in most books on foundation engineering is too simple to handle actual excavation analysis and design Moreover with economic development and urbanization excavations go deeper and are larger in scale These conditions require elaborate analysis design methods and construction technologies This book is aimed at both theoretical explication and practical application From basic to advanced this book attempts to achieve theoretical rigor and consistency Each chapter is followed by a problem set so that the book can be readily taught at senior undergraduate and graduate levels The solution to the problems at the end of the chapters can be found on the website <http://www.ct.ntust.edu.tw/ou> On the other hand the analysis methods introduced in the book can be used in actual analysis and design as they contain the most up to date knowledge Therefore this book is suitable for teachers who teach foundation engineering and or deep excavation courses and engineers who are engaged in excavation analysis and design

Foundation Engineering Handbook Hsai-Yang Fang, 2013-06-29 More than ten years have passed since the first edition was published. During that period there have been a substantial number of changes in geotechnical engineering, especially in the applications of foundation engineering. As the world population increases, more land is needed and many soil deposits previously deemed unsuitable for residential housing or other construction projects are now being used. Such areas include problematic soil regions, mining subsidence areas and sanitary landfills. To overcome the problems associated with these natural or man-made soil deposits, new and improved methods of analysis, design and implementation are needed in foundation construction. As society develops and living standards rise, tall buildings, transportation facilities and industrial complexes are increasingly being built. Because of the heavy design loads and the complicated environments, the traditional

design concepts construction materials methods and equipment also need improvement Further recent energy and material shortages have caused additional burdens on the engineering profession and brought about the need to seek alternative or cost saving methods for foundation design and construction
