Model-Based Estimation Applications for GNSS Remote Sensing Karen Qing Zi Chiang, 2016 The Global Navigation Satellite System GNSS is a valuable tool for Earth and Atmospheric Science as it not only provides position and attitude information for remote sensing platforms but its variety of radio signals may also be used to probe the atmosphere This dissertation presents a set of projects that aim to improve several of these functions by employing model based estimation techniques The first algorithm addresses the issue of large uncertainties in the dynamic variations of signal observables due to refraction during Earth limb scanning It pre processes raw GNSS data with a Levenberg Marquardt batch filter and performs signal tracking with a Square Root Extended Kalman Filter SREKF in a new type of combined phase locked delay locked loop This constitutes an alternate way for deducing meteorological conditions down to few metres from the terrestrial surface using GNSS signals The second project estimates the attitude of a spinning sounding rocket carrying sensors for studying space weather The GPS attitude determination problem for this rocket poses two major challenges that result from equipment limitations Frequent signal data gaps due to telemetry bandwidth restrictions and only one antenna baseline vector with which to perform full three axis attitude determination The first problem is circumvented by an adaptation of the algorithm from the first project and the second by using another Levenberg Marquardt batch filter that contains an Euler dynamics model The last project combines refractive ray tracing concepts and an SREKF utilizing both ionosonde and GNSS signals in order to solve for the parameters of a node based profile of the ionosphere In addition a trust region reflective algorithm a modern form of the Levenberg Marquardt algorithm is used to extract electron content information from GNSS data to parameterize ionospheric irregularities resulting from an experiment that involves controlled heating of the ionosphere

Algebraic Geodesy and Geoinformatics Joseph L. Awange, Erik W. Grafarend, Béla Paláncz, Piroska Zaletnyik, 2010-05-27 While preparing and teaching Introduction to Geodesy I and II to undergraduate students at Stuttgart University we noticed a gap which motivated the writing of the present book Almost every topic that we taught required some skills in algebra and in particular computer algebra From positioning to transformation problems inherent in geodesy and geoinformatics knowledge of algebra and application of computer algebra software were required In preparing this book therefore we have attempted

to put together basic concepts of abstract algebra which underpin the techniques for solving algebraic problems Algebraic computational algorithms useful for solving problems which require exact solutions to nonlinear systems of equations are presented and tested on various problems Though the present book focuses mainly on the two elds the concepts and techniques presented herein are nonetheless applicable to other elds where algebraic computational problems might be encountered In Engineering for example network densi cation and robotics apply resection and intersection techniques which require algebraic solutions Solution of nonlinear systems of equations is an indispensable task in almost all geosciences such as geodesy geoinformatics geophysics just to mention but a few as well as robotics These equations which require exact solutions underpin the operations of ranging resection intersection and other techniques that are normally used Examples of problems that require exact solutions include three dimensional resection problem for determining positions and orientation of sensors e g camera theodolites robots scanners etc

methods Geodesy for Planet Earth Steve Kenyon, Maria Christina Pacino, Urs Marti, 2012-03-08 These proceedings include the written version of 130 papers presented at the International Association of Geodesy IAG2009 Geodesy for Planet Earth Scientific Assembly. It was held 31 August to 4 September 2009 in Buenos Aires, Argentina. The theme Geodesy for Planet Earth was selected to follow the International Year of Planet Earth 2007-2009 goals of utilizing the knowledge of the world's geoscientists to improve society for current and future generations. The International Year started in January 2007 and ran thru 2009, which coincided with the IAG2009 Scientific Assembly, one of the largest and most significant meetings of the Geodesy community held every 4 years. The IAG2009 Scientific Assembly was organized into eight Sessions. Four of the Sessions of IAG2009 were based on the IAG Structure, i.e. one per Commission and covered Reference Frames, Gravity Field, Earth Rotation and Geodynamics, and Positioning and Applications. Since IAG2009 was taking place in the great Argentine city of Buenos Aires, a Session was devoted to the Geodesy of Latin America. A Session dedicated to the IAG's Global Geodetic Observing System (GGOS), the primary observing system focused on the multidisciplinary research being done in Geodesy that contributes to important societal issues such as monitoring global climate change and the environment. A Session on the IAG Services was also part of the Assembly, detailing the important role they play in providing geodetic data products and analysis to the scientific community. A final Session devoted to the organizations ION, FIG, and IPRS and their significant work in navigation and earth observation that complements the IAG.

The Space Industry of the Future Mark W. McElroy Jr., 2022-09-19 The Space Industry of the Future consists of the first instance of guidance for the space industry on how value creation in space can occur for the greater benefit of humanity using principles of capitalism and sustainability. The timing of this book is ideal given 1) sustainability challenges facing humanity and 2) that the growth of the commercial space economy is now occurring at a rate never seen before. This book presents an opportune guide written for technical business and policy practitioners alike that frames how this industry growth should occur from an integrated values and commercial perspective. This perspective is presented in the context of the modern technical capabilities of space systems relative to the world's greatest problems. The guidance contained in this book for the growing commercial space industry includes considerations beyond profit seeking alone. This guidance is founded on a bespoke value creation criteria to apply in the context of for-profit outer space activities that if used will result in the maximum value creation that a company is capable of. The criteria are developed and presented through a rigorous discussion on capitalism, economics, value theory, the circular economy, stakeholder management, and ethics. The value creation criteria are then discussed at length in relation to the space industry. The primary audience for this book is practitioners within the space industry; this includes investors, business managers, policy makers, engineers, and scientists. The secondary audience includes students and researchers as well as a growing range of parties interested in space policy and entrepreneurship.
