Mass Production Of Beneficial Organisms Invertebrates And Entomopathogens:

Mass Production of Beneficial Organisms Juan A. Morales-Ramos, M. Guadalupe Rojas, David I. Shapiro-Ilan, 2013-10-08

Mass Production of Beneficial Organisms Invertebrates and Entomopathogens is an essential reference and teaching tool for researchers in developed and developing countries working to produce natural enemies in biological control and integrated pest management programs. As we become aware of the negative impact of pesticides in human health and on the environment, interest is rapidly increasing in developing biological pest control alternatives. Tremendous advances have been made in beneficial organism technology such as insect predators and parasitoids, mite predators, entomopathogenic nematodes, fungi, bacteria, and viruses. However, developing techniques to mass produce these biological control agents is not enough if the cost of commercialization is prohibitive. Advancing mass production to the level of economic feasibility is critical so these new technologies can compete in the open market. This book educates academic and industry researchers and enables further development of mass production so new technologies can compete in the open market. It is also an excellent resource for those researching beneficial arthropod mass production and technologies for other uses, including for study and application in biotechnology and biomedical research. Focuses on techniques for mass production of beneficial organisms and methods of evaluation and quality assessment. Organizes and presents the most advanced and current knowledge on methods to mass produce beneficial organisms in response to the increased global demand for alternatives to chemical pesticides for biological control producers. Includes a team of highly respected editors and authors with broad expertise in these areas.

Mass Production of Beneficial Organisms Invertebrates and Entomopathogens Second Edition explores the latest advancements and technologies for large scale rearing and manipulation of natural enemies while presenting ways of improving success rate, predictability of biological control procedures, and demonstrating their safe and effective use. Organized into three sections: Parasitoids and Predators, Pathogens, and Invertebrates for Other Applications, this second edition contains important new information on production technology of predatory mites and hymenopteran parasitoids for biological control, application of insects in the food industry, and production methods of insects for feed and food, and production of bumble bees for pollination. Beneficial organisms include not only insect predators and parasitoids but also mite predators, nematodes, fungi, bacteria, and viruses. In the past two decades, tremendous advances have been achieved in developing technology for producing these organisms. Despite that, and the globally growing research and interest in biological control and biotechnology applications, commercialization of these technologies is still in progress. This is an essential reference and teaching tool for researchers in developed and developing countries working to produce natural enemies in biological control and integrated pest management programs. Highlights the most advanced and current techniques for mass production of beneficial organisms and methods of evaluation and quality assessment. Presents methods

for developing artificial diets and reviews the evaluation and assurance of the quality of mass produced arthropods Provides an outlook of the growing industry of insects as food and feed and describes methods for mass producing the most important insect species used as animal food and food ingredients
