Biocontrol of Lepidopteran Pests K. Sowjanya Sree, Ajit

Varma, 2015-02-17 This volume describes the various applications of entomopathogenic soil microorganisms in the management and control of the devastating lepidopteran pest. An introduction describes the insecticidal properties of viruses, bacteria, fungi, nematodes and their metabolites as well as their applications in the context of crop improvement. Subsequent chapters focus on topics such as insecticidal proteins, the role of nucleopolyhedroviruses, Bt toxins and their receptors, control of lepidopterans using entomopathogenic fungi, management of cotton defoliators and sustainable use of entomopathogenic nematodes and their bacterial symbionts. An overview of culture collections of entomopathogenic microorganisms rounds out the volume. *Cumulated Index Medicus*, 1999

Microbes for Sustainable Insect Pest Management Md. Aslam

Khan, Wasim Ahmad, 2019-09-16 This Volume comprises 14 chapters in an attempt to provide the reader with available information on safe and effective use of entomopathogens. Chapters in this book dealing with soil borne entomopathogens and their phylogeny also provide a review on most updated information of their isolation and molecular identification. Employing fungal pathogens in biological control programmes plays a key role and conidial thermotolerance and oxidative stress are examined in separate chapters. Entomopathogenic bacteria are able to kill their hosts quickly. An important contribution concerns information provided upon bacterial cytotoxic factors on insect haemocytes. Nematodes are biological control agents safe to the environment. The information with respect to their direct and indirect effects on non target organisms is provided. Viruses as highly specific virulent candidates for use as biological insecticides are safe to non target species. A separate chapter on the role of granuloviruses in IPM contributes a wealth of information. Biopesticides in combination with synthetic insecticides are reported as effective, economic and eco friendly. Understanding their interactions will certainly promote their uses. Finally, emphasis has been given on reviewing synergistic and antagonistic interactions of microbial and chemical pesticides in other chapters. *The Claustrum* John R. Smythies, Lawrence Edelstein, Vilayanur S.

Ramachandran, 2013-11-11 The present day is witnessing an explosion of our understanding of how the brain works at all levels in which complexity is piled on complexity and mechanisms of astonishing elegance are being continually discovered. This process is most developed in the major areas of the brain such as the cortex, thalamus and striatum. The Claustrum instead focuses on a small, remote and until recently relatively unknown area of the brain. In recent years, researchers have come to believe that the claustrum is concerned with consciousness, a bold hypothesis supported by the claustrum's two way connections with nearly every other region of the brain and its seeming involvement with multisensory integrations, the hallmark of consciousness. The claustrum previously in a humble position at the back of the stage might in fact be the conductor of the brain's orchestra. The Claustrum brings together leading experts on the claustrum from the varied disciplines of neuroscience, providing a state of the art presentation of what is currently known about the claustrum.

promising lines of current research including epigenetics and projections of new lines of investigation on the horizon Develops a unifying hypothesis about the claustrum's role in consciousness as well as the integration of sensory information and other higher brain functions Discusses the involvement of the claustrum with autism schizophrenia epilepsy Alzheimer's disease and Parkinson's disease Coverage of all aspects of the claustrum from its evolution and development to promising new lines of research including epigenetics provides a platform and point of reference for future investigative efforts

Controlled Release, Biochemical Effects of Pesticides, Inhibition of Plant Pathogenic Fungi, 2012-12-06

Since the middle of the Sixties new types of formulation for biologically active compounds have been developed which have been introduced into the literature under the term Controlled Release Formulations (CRF). Stimulated by results from former and successful pharmaceutical research which was engaged in the production of preparations with protracted effects, introduction onto the market in the year 1952 of D-amphetamine in the form of pellets coated to varying degrees with fats and waxes, 1 experiments were carried out to transfer the prolongation of effectiveness to pesticidal substances also by means of a depot formulation. Initial work was concerned with the production of protective coatings for sonar systems in marine ecosystems. By means of antifouling paints or rubber coatings containing tri-n-butyl tin oxide (TBTO) the growth of marine organisms on sonar domes, buoys and hulls in the water could be effectively prevented. 2, 3 Controlled release formulations of pesticides are defined as depot systems which continuously release their toxic constituents into the environment over a specified period of time, usually months to years. 4 According to this definition such formulations can be successfully employed where a chronic exposure to biologically active compounds is required over a longer period. The following hypothetical example is intended to illustrate this. 5 In Fig. 1 the duration of activity of a non-persistent pesticide with a loss rate under environmental conditions of $t_{1/2}$ 15 days is graphically illustrated.
