Performance Analysis of Mpls and Non-Mpls Network Md. Zahirul Islam,Md. Mohiuddin Ahmed,2011-09 Now a days Multi Protocol label switching MPLS is the new WAN Wide Area Network technology which is used in routers for long distance communication In this thesis we compare the performance and convergence time between two same topology where one is configured with MPLS technology and other one is configured with convectional WAN technology HDLC MPLS carries differentiated services across the Internet through a virtual path capability between packet label switches In order to simulate the result we use cisco packet tracer 5 3 and GNS3 0 7 software Using packet tracer we configure HDLC and using GNS3 we configure MPLS and for this purpose we use cisco c7200 router After the comparison we found that MPLS has the capabilities to engineer traffic tunnels by avoiding congestion and utilizing all available bandwidth with an efficient manner and it has faster convergence time **Definitive MPLS Network Designs** Jim Guichard,François Le

Faucheur,Jean-Philippe Vasseur,2005-03-14 Field proven MPLS designs covering MPLS VPNs pseudowire QoS traffic engineering IPv6 network recovery and multicast Understand technology applications in various service provider and enterprise topologies via detailed design studies Benefit from the authors vast experience in MPLS network deployment and protocol design Visualize real world solutions through clear detailed illustrations Design studies cover various operator profiles including an interexchange carrier IXC a national telco deploying a multiservice backbone carrying Internet and IP VPN services as well as national telephony traffic an international service provider with many POPs all around the globe and a large enterprise relying on Layer 3 VPN services to control communications within and across subsidiaries Design studies are thoroughly explained through detailed text sample configurations and network diagrams Definitive MPLS Network Designs provides examples of how to combine key technologies at the heart of IP MPLS networks Techniques are presented through a set of comprehensive design studies Each design study is based on characteristics and objectives common to a

given profile of network operators having deployed MPLS and discusses all the corresponding design aspects. The book starts with a technology refresher for each of the technologies involved in the design studies. Next a series of design studies is presented each based on a specific hypothetical network representative of service provider and enterprise networks running MPLS. Each design study chapter delivers four elements. They open with a description of the network environment including the set of supported services, the network topology, the POP structure, the transmission facilities, the basic IP routing design and possible constraints. Then the chapters present design objectives such as optimizing bandwidth usage. Following these are details of all aspects of the network design covering VPN, QoS, TE, network recovery and where applicable multicast IPv6 and pseudowire. The chapters conclude with a summary of the lessons that can be drawn from the design study so that all types of service providers and large enterprise MPLS architects can adapt aspects of the design solution to their unique network environment and objectives. Although network architects have many resources for seeking information on the concepts and protocols involved with MPLS, there is no single resource that illustrates how to design a network that optimizes their benefits for a specific operating environment. The variety of network environments and requirements makes it difficult to provide a one size fits all design recommendation. **Definitive MPLS Network Designs** fills this void. This book comes as a boon to professionals who want to understand the power of MPLS and make full use of it. Parantap Lahiri, Manager IP Network Infrastructure Engineering, MCI.
