**the Study, Practice, and Tools of Modern Mathematics** Donald Bindner, Martin Erickson, 2010-11-29 A Student's Guide to the Study Practice and Tools of Modern Mathematics provides an accessible introduction to the world of mathematics. It offers tips on how to study and write mathematics as well as how to use various mathematical tools from LaTeX and Beamer to Mathematica and Maple to MATLAB and R. Along with a color insert, the text includes Scientific Computing with MATLAB and Octave. Alfio Quarteroni, Fausto Saleri, Paola Gervasio, 2014-02-20 This textbook is an introduction to Scientific Computing in which several numerical methods for the computer-based solution of certain classes of mathematical problems are illustrated. The authors show how to compute the zeros, the extrema, and the integrals of continuous functions, solve linear systems, approximate functions using polynomials, and construct accurate approximations for the solution of ordinary and partial differential equations. To make the format concrete and appealing, the programming environments Matlab and Octave are adopted as faithful companions. The book contains the solutions to several problems posed in exercises and examples, often originating from important applications. At the end of each chapter, a specific section is devoted to subjects which were not addressed in the book and contains bibliographical references for a more comprehensive treatment of the material. From the review: This carefully written textbook, the third English edition, contains substantial new developments on the numerical solution of differential equations. It is typeset in a two-color design and is written in a style suited for readers who have mathematics, natural sciences, computer sciences, or economics as a background and who are interested in a well-organized introduction to the subject. Roberto Plato, Siegen Zentralblatt MATH 1205.65002 **Handbook of Computational Finance** Jin-Chuan Duan, Wolfgang Karl Härdle, James E. Gentle, 2011-10-25 Any financial asset that is openly traded has a market price. Except for extreme market conditions, market price may be more or less than a fair value. Fair value is likely to be some complicated function of the current intrinsic value of tangible or intangible assets underlying the claim and our assessment of the characteristics of the underlying assets with respect to the expected rate of growth, future dividends, volatility, and other relevant market factors. Some of these factors that affect the price can be measured at the time of a transaction with reasonably high accuracy. Most factors, however, relate to expectations about the future and to subjective issues such as current management, corporate policies, and market environment that could affect the future financial performance of the underlying assets. Models are thus needed to describe the stochastic factors and environment and their implementations inevitably require computational finance tools. **Quantitative Methods in Tourism** Rodolfo Baggio, Jane Klobas, 2011-03-15 Tourism studies often deal with complex mixes of external and local factors and the attitudes, perceptions, and actions of tourists themselves. In seeking to understand individual elements of this mix or the results of interactions between them, tourism authorities, managers, and researchers often collect quantitative data, but until now the few existing guides to understanding quantitative data have been either very simple or very complicated. This book provides a guide to dealing with real-world data and goes beyond the methods usually covered in introductory textbooks. The first part considers

key issues associated with using well known methods to produce valid and reliable models of real world phenomena emphasizing issues in data selection approaches to factor and cluster analysis and mathematical modelling using regression methods including logistic regression and structural equation modelling The second part covers new approaches to modelling maximum likelihood estimation simulation and agent based modelling Each chapter includes extensive references to additional reading and an appendix summarises the software introduced in the book The book provides many practical examples of applications to tourism research considers practical issues associated with application of quantitative techniques and discusses common pitfalls and how to identify and remedy them The result is a guide to quantitative methods in tourism that demystifies both simple and apparently complex techniques and makes them more accessible to tourism researchers

**High performance computing for solving large sparse systems. Optical diffraction tomography as a case of study** Gloria Ortega López, 2015-04-14 This thesis entitled High Performance Computing for solving large sparse systems

Optical Diffraction Tomography as a case of study investigates the computational issues related to the resolution of linear systems of equations which come from the discretization of physical models described by means of Partial Differential Equations PDEs These physical models are conceived for the description of the space temporary behavior of some physical phenomena  $f(x, y, z, t)$  in terms of their variations partial derivative with respect to the dependent variables of the phenomena There is a wide variety of discretization methods for PDEs Two of the most well known methods are the Finite Difference Method FDM and the Finite Element Method FEM Both methods result in an algebraic description of the model that can be translated into the approach of a linear system of equations of type  $Ax = b$  where  $A$  is a sparse matrix a high percentage of zero elements whose size depends on the required accuracy of the modeled phenomena This thesis begins with the algebraic description of the model associated with the physical phenomena and the work herein has been focused on the design of techniques and computational models that allow the resolution of these linear systems of equations The main interest of this study is specially focused on models which require a high level of discretization and usually generate sparse matrices  $A$  which have a highly sparse structure and large size Literature characterizes these types of problems by their high demanding computational requirements because of their fine degree of discretization and the sparsity of the matrices involved suggesting that these kinds of problems can only be solved using High Performance Computing techniques and architectures One of the main goals of this thesis is the research of the possible alternatives which allow the implementation of routines to solve large and sparse linear systems of equations using High Performance Computing HPC The use of massively parallel platforms GPUs allows the acceleration of these routines because they have several advantages for vectorial computation schemes On the other hand the use of distributed memory platforms allows the resolution of problems defined by matrices of enormous size Finally the combination of both techniques distributed computation and multi GPUs will allow faster resolution of interesting problems in which large and sparse matrices are involved In this line one of the goals of this thesis is to supply the scientific community with implementations based on multi GPU clusters to solve sparse linear systems of equations which are the key in many scientific computations The second part of this thesis is focused on a real physical problem of Optical Diffractional Tomography ODT based on holographic information ODT is a non damaging technique which allows the extraction of the shapes of objects with high accuracy Therefore this technique is very suitable to the in vivo study of real specimens microorganisms etc and it also makes the investigation of their dynamics possible A preliminary physical model based on a bidimensional reconstruction of the seeding particle distribution in fluids was proposed by J Lobera and J M Coupland However its high computational cost in both memory requirements and runtime made compulsory the use of HPC techniques to extend the implementation to a three dimensional model In the second part of this thesis the implementation and validation of this physical model for the case of three dimensional reconstructions is carried out In such implementation the resolution of large and sparse linear systems of equations is required Thus some of the algebraic routines developed in

the first part of the thesis have been used to implement computational strategies capable of solving the problem of 3D reconstruction based on ODT
