

LM6000 Aeroderivative Gas Turbines

The LM6000 is a simple-cycle, two-shaft, high performance gas turbine derived from the GE CF6-80C2 high bypass turbofan aircraft engine, the industry standard for high-thrust engines. Delivering more than 44.8 MW at over 42.7% thermal efficiency, the powerful LM6000 is the most fuel-efficient, simple-cycle gas turbine in the world. Direct drive provides 60,000 shaft horsepower from either end of the low pressure rotor for a wide range of electric power generation and mechanical drive applications in any environment.

High thermal efficiency, low cost, and installation flexibility make the LM6000 the ideal choice as a prime driver for utility peaking, mid-range, and base load operations, as well as for industrial cogeneration.

The LM6000's design allows full speed range capability from 50-105% of the rated speed of 3600 RPM. Continuing the tradition of the established record of GE's LM2500, the LM6000 is ideal as a source of drive-power for pipeline compression, offshore platform and gas re-injection, as well as for LNG compressors. The LM6000 was GE's first aeroderivative gas turbine to employ the new Dry Low Emissions (DLE) premixed combustion system. DLE dual fuel, water or steam injection can also be used to achieve low NOx emissions.
