investigators need to be aware of the needs of the transplant field to bring these two fields together for greater results
Bridges the gap between regenerative medicine and solid organ transplantation and highlights reasons for collaboration
Explains the importance and future potential of regenerative medicine to the transplant community Illustrates to regenerative medicine investigators the needs of the transplant discipline to drive and guide investigations in the most promising directions

Hepatobiliary Transport in Health and Disease Dieter Häussinger, Verena Keitel, Ralf Kubitz, 2012-05-29 One major function of the liver is the uptake of endo and xenobiotics from the bloodstream and their excretion into bile The transport systems involved in hepatobiliary transport have been recently cloned and characterized at the molecular level and it is becoming clear that mutations and polymorphisms of individual transporter molecules underlie a variety of liver diseases Furthermore new research has shown that bile acids whose function in digestion is long known also behave as signal molecules in a variety of organs including the intestinal and biliary epithelia sinusoidal endothelial and immune cells This book provides indepth surveys on the structure and function of transport molecules involved in hepatobiliary transport on the role of different bile acids receptors in various organs and their function in health and disease the mechanisms of bile salt induced apoptosis and hepatocyte protection and the role of transporter mutations as causes and modifiers of liver diseases The book will be of interest not only for biochemists structural chemists and biologists but also for clinicians

Nuclear Volume and Cellular Metabolism R. Hildebrand, 2013-11-11 The application of morphometric techniques in biology and the development of biochemical methods for cytological histological research have deepened substantially our knowledge and understanding of the structure dynamics and function of morphological structures thereby improving upon a purely descriptive presentation Thus the limits between the individual disciplines in basic research have become blurred With the development of suitable methods of measuring the size of nuclear volumes it has become possible to obtain data regarding the variable state and nucleokinetic processes in the genetic center of control of the cell Siebert 1967 and to evaluate these data statistically so as to make them verifiable With the formulation of the basic law of karyometry by Palkovits and Fischer 1968 in a dynamic approach to genetic and functional trends in karyometry is an attempt to relate nuclear volume changes exclusively to the size and number of chromosomes and on the other hand to comprehend these changes as an expression of functional changes successfully connected with one another and interpreted biologically The early function oriented observation that a swelling of the nuclear volume is an expression of an increase in cellular function while a decrease in the volume is an indication of a lowering of activity provided a preliminary basis for estimating nuclear size as a statement about the functional state of a tissue or organ
