Grafting and Budding WJ Lewis, DMcE Alexander, 2008-08-11 *Grafting and Budding A Practical Guide for Fruit and Nut Plants and Ornamentals* is an updated and expanded version of *Grafting and Budding Fruit and Nut Trees* and now includes the grafting of ornamental plants. It is a comprehensive and clearly written practical guide to all of the grafting and budding techniques any professional or home gardener is likely to need. The book begins with a brief history of the subject, explains how grafting works and shows why it is now the preferred technique for propagating most commercial plants. It then describes the basics of budding, grafting and multi grafting and presents step by step instructions for making the special cuts used in grafting and budding. Advice is also given on the selection of scion wood, the preparation of rootstocks and the after care of grafted plants. The methods of budding and grafting are explained in fine detail including T budding, chip budding and patch budding, the splice graft, wedge graft, whip and tongue graft, side graft, bark graft and approach graft, the grafting of herbaceous plants and machine bench grafting. More than 60 sketches and photographs are included to help illustrate various aspects of the skill of grafting. New to this edition are sections covering the preferred methods of propagation for Australian natives such as eucalypts, banksias, hakeas and grevilleas, cacti, conifers, general deciduous ornamentals, black passionfruit, roses and tomatoes, making it an indispensable addition to any avid gardener's bookshelf. *The Art of Grafting and Budding* Charles Baltet, 1882 *The Art of Grafting and Budding* Charles Baltet, 2013-09 This historic book may have numerous typos and missing text. Grafting with a Cutting for the Scion. In this method the scion only is a cutting, the stock is a tree which has been at least a year planted. It may be left entire or headed down at the time of grafting and may be grafted either close to the ground or at some distance from it under the surface of the soil or above it. Cutting Grafting on a Low Stem. There are two principal methods based on the previous wputation of the stem or otherwise. Here the stock is shortened to within 4 inches or 8 inches from the neck. We then take a scion branch of sufficient length that when its extremity is buried in the soil as a cutting close to the stock it may be grafted on the stock and have a couple of buds above the graft. The stock is channelled with the gouge and the bark is removed from that part of the scion which is to be placed in the groove. They are then bandaged and covered with mastic. When a vine is grafted in this way the soil is heaped up about it so as to cover the graft. When the stem of the vine is young or if it is furnished with vigorous shoots at the base we have recourse to layer grafting. A small trench or hole is made B in which the shoot is to be layered. The shoot to be grafted is then cut down to the third Layer Grafting eye as at A. The other shoots of the same stock are removed or cut short or grafted in the same way. The scion is grafted at A in the English fashion then cut so as to leave two or three eyes over ground and fastened to a stake. Should the stock offer any resistance it can be pegged down in the bottom of the trench with a forked stick. The hole or trench B should then be filled with good free soil which will facilitate the production of

Grafting and Budding in Fruit Trees Sherif Fathy Eid El-Sayed EL Gioushy, Yasser Mohammed Hussein, 2013 Many people mistakenly believe that fruit trees grow true to name from seeds In reality if you collect seed from a fruit grown on a plant the seeds will produce plants that will be a hybrid of two plants The new plant will be the same kind of plant but its fruit and vegetative portions may not look the same as the parent because the plant is heterozygous Therefore all fruit trees must be vegetatively propagated by either grafting or budding methods Fruit growers frequently use grafting techniques to topwork new varieties or strains of fruit onto established trees bearing misnamed or obsolete varieties and to repair injury or damage caused by mice rabbits deer or mechanical means Commercial nursery workers propagate new fruit trees and producing a tree ready for planting takes several years All of the temperate zone deciduous fruit plants may be propagated by budding Cleft whip and bridge grafting of apple and pear is possible but such grafts are not often successful on stone fruits Sweet cherry and occasionally peach may be successfully grafted using the side graft onto a 2 to 3 year old limb
