**Rule Extraction from Support Vector Machines** Joachim Diederich, 2008-01-04 Support vector machines SVMs are one of the most active research areas in machine learning SVMs have shown good performance in a number of applications including text and image classification However the learning capability of SVMs comes at a cost an inherent inability to explain in a comprehensible form the process by which a learning result was reached Hence the situation is similar to neural networks where the apparent lack of an explanation capability has led to various approaches aiming at extracting symbolic rules from neural networks For SVMs to gain a wider degree of acceptance in fields such as medical

diagnosis and security sensitive areas it is desirable to offer an explanation capability User explanation is often a legal requirement because it is necessary to explain how a decision was reached or why it was made This book provides an overview of the field and introduces a number of different approaches to extracting rules from support vector machines developed by key researchers In addition successful applications are outlined and future research opportunities are discussed The book is an important reference for researchers and graduate students and since it provides an introduction to the topic it will be important in the classroom as well Because of the significance of both SVMs and user explanation the book is of relevance to data mining practitioners and data analysts

Instance Selection and Construction for Data Mining Huan Liu, Hiroshi

Motoda,2013-03-09 The ability to analyze and understand massive data sets lags far behind the ability to gather and store the data To meet this challenge knowledge discovery and data mining KDD is growing rapidly as an emerging field However no matter how powerful computers are now or will be in the future KDD researchers and practitioners must consider how to manage ever growing data which is ironically due to the extensive use of computers and ease of data collection with computers Many different approaches have been used to address the data explosion issue such as algorithm scale up and data reduction Instance example or tuple selection pertains to methods or algorithms that select or search for a representative portion of data that can fulfill a KDD task as if the whole data is used Instance selection is directly related to data reduction and becomes increasingly important in many KDD applications due to the need for processing efficiency and or storage efficiency One of the major means of instance selection is sampling whereby a sample is selected for testing and analysis and randomness is a key element in the process Instance selection also covers methods that require search Examples can be found in density estimation finding the representative instances data points for a cluster boundary hunting finding the critical instances to form boundaries to differentiate data points of different classes and data squashing producing weighted new data with equivalent sufficient statistics Other important issues related to instance selection extend to unwanted precision focusing concept drifts noise outlier removal data smoothing etc Instance Selection and Construction for Data Mining brings researchers and practitioners together to report new developments and applications to share hard learned experiences in order to avoid similar pitfalls and to shed light on the future development of instance selection This volume serves as a comprehensive reference for graduate students practitioners and researchers in KDD

**Pattern Recognition** Petra Perner, 2009-07-21. There is no royal road to science and only those who do not dread the fatiguing climb of its steep paths have a chance of gaining its luminous summits. Karl Marx. A Universal Genius of the 19th Century. Many scientists from all over the world during the past two years since the MLDM 2007 have come along on the stony way to the sunny summit of science and have worked hard on new ideas and applications in the area of data mining in pattern recognition. Our thanks go to all those who took part in this year's MLDM. We appreciate their submissions and the ideas shared with the Program Committee. We received over 205 submissions from all over the world to the International Conference on Machine Learning and Data Mining (MLDM 2009). The Program Committee carefully selected the best papers for this year's program and gave detailed comments on each submitted paper. There were 63 papers selected for oral presentation and 17 papers for poster presentation. The topics range from theoretical topics for classification, clustering, association rule and pattern mining to specific data mining methods for the different multimedia data types such as image mining, text mining, video mining and Web mining. Among these topics this year were special contributions to subtopics such as attribute discretization and data preparation, novelty and outlier detection and distances and similarities.
