Parameter Extraction and Complex Nonlinear Transistor Models

Gunter Kompa, 2019-12-31. All model parameters are fundamentally coupled together so that directly measured individual parameters, although widely used and accepted, may initially only serve as good estimates. This comprehensive resource presents all aspects concerning the modeling of semiconductor field effect device parameters based on gallium arsenide (GaAs) and gallium nitride (GaN) technology. Metal semiconductor field effect transistors (MESFETs), high electron mobility transistors (HEMTs), and heterojunction bipolar transistors (HBTs), their structures and functions, and existing transistor models are also classified. The Shockley model is presented in order to give insight into semiconductor field effect transistor (FET) device physics and explain the relationship between geometric and material parameters and device performance. Extraction of trapping and thermal time constants is discussed. A special section is devoted to standard nonlinear FET models applied to large signal measurements including static pulsed DC and single two-tone stimulation. High power measurement setups for signal waveform measurement, wideband source load pull measurement including envelope source load pull, are also included along with high power intermodulation distortion (IMD) measurement setup including envelope load pull. Written by a world renowned expert in the field, this book is the first to cover all aspects of semiconductor FET device modeling in a single volume.
