

Cellular Respiration in Yeast

All living cells, including the cells in your body and the cells in yeast, need energy for cellular processes such as pumping molecules into or out of the cell or synthesizing molecules. **ATP** is a special molecule which provides energy in a form that cells needed can use for cellular processes.

Cellular respiration is the process that cells use to transfer energy from the organic molecules in food to ATP. The following equation summarizes the chemical changes that occur in cellular respiration of the monosaccharide glucose when oxygen is available.

The chemical reactions in cellular respiration are similar to the chemical reactions when organic compounds are burned, but of course no ATP is produced. Instead energy is released in the form of light and heat. The following equation shows the chemical changes that occur when the monosaccharide glucose is burned.

There is another important feature of cellular respiration which is not shown in these equations. Cellular respiration involves many small steps; these multiple steps allow the cell to use the energy from each glucose molecule efficiently in order to make as many ATP molecules as possible. The multiple steps of cellular respiration are described in your textbook. Our description will focus on some major steps and how these steps differ, depending on whether oxygen is available or not.

The first major step in cellular respiration is **glycolysis**:

What happens next depends on whether or not oxygen is available to the cells. When oxygen is available, cells can use the **Krebs cycle** and the **electron transport chain** to make up to 36 ATPs.

Cellular respiration that uses O_2 is called **aerobic respiration**. Most of the time, the cells in our bodies use aerobic respiration:

Unfortunately, while information is plentiful, all this attention has resulted in a scattered database on photosynthesis with no contemporary starting point at least until now. Together they have created a comprehensive reference that in a single volume includes important background information as well as the most recent research findings on photosynthesis. Completely Revised with Several New Chapters. The handbook is a completely updated reworking of the critically acclaimed first edition. It details all of the photosynthetic factors and processes under both normal and stressful conditions, covering lower and higher plants as well as related biochemistry and plant molecular biology. Divided into fourteen sections for ease of reference, with nearly 8000 bibliographic citations, the handbook contains authoritative contributions from over 80 scientists.
