Gravitational Lens Deep Space Probe Design:

Gravitational Lens Air Force Air Force Institute of Technology, 2014-10-31 A number of interstellar precursor missions have been designed but they have all made use of unproven future technologies This research focuses on designing an interstellar precursor mission to the gravitational lens that can be manufactured solely with today's technology The design includes an examination of trip time and trajectory a system trade between subsystems a launch vehicle analysis and an overall spacecraft performance analysis The trip time was found to be approximately 108 years using the NEXT thruster and GPHS power source The GPHS provided approximately 4 kW of power at BOL The communications subsystem relied on a 12 meter high gain antenna which also serves as the primary payload and a 2 meter medium gain antenna Finally the estimated mission cost is 3.5 billion USD Gravitational Lens Berkley R. Davis, 2012 Deep-Space Probes Gregory L. Matloff, 2013-11-27 This excellent book by Dr Gregory Matloff could be viewed as a large multi disciplinary compendium of past research current investigations and future research in astronautics However unlike conventional works that are usually closed this book is an open guide in three main respects it contains progressive exercises as the chapter and section topics evolve it provides the reader with many updated references and it clearly indicates projected research areas that could become current research in the near future For a student the included exercises could be transformed into small worksheets or notebooks featuring many modern symbolic or algebraic computation systems that run on desktop or laptop computers Thus rapid and progressive study is possible a sort of learning library driven by the author and by the bibliography at the end of each chapter More than 340 references for both professionals and students have been selected to provide the reader with a sound basis for expanding his or her knowledge of the many different subjects dealt with authoritatively by the author who for several decades has worked actively in various fields of astronautics A systematic and unhurried study of this book will produce for the reader an extraordinarily enlarged number based view of spaceflight and its significant impact on our future global society Deep Space Probes Gregory L. Matloff, 2006-08-31 The Space Age is nearly 50 years old but exploration of the outer planets and beyond has only just begun Deep Space Probes Second Edition draws on the latest research to explain why we should explore beyond the edge of the Solar System and how we can build highly sophisticated robot spacecraft to make the journey Many technical problems remain to be solved among them propulsion systems to permit far higher velocities and technologies to build vehicles a fraction of the size of today's spacecraft Beyond the range of effective radio control robot vehicles for exploring deep space will need to be intelligent thinking craft able to make vital decisions entirely on their own Gregory Matloff also looks at the possibility for human travel into interstellar space and some of the immense problems that such journeys would entail This second edition includes an entirely new chapter on holographic message plaques for future interstellar probes a NASA funded project Deep Space Propulsion K. F. Long, 2011-11-25 The technology of the next few decades could possibly allow us to explore with robotic probes the closest stars outside our Solar

System and maybe even observe some of the recently discovered planets circling these stars This book looks at the reasons for exploring our stellar neighbors and at the technologies we are developing to build space probes that can traverse the enormous distances between the stars In order to reach the nearest stars we must first develop a propulsion technology that would take our robotic probes there in a reasonable time Such propulsion technology has radically different requirements from conventional chemical rockets because of the enormous distances that must be crossed Surprisingly many propulsion schemes for interstellar travel have been suggested and await only practical engineering solutions and the political will to make them a reality This is a result of the tremendous advances in astrophysics that have been made in recent decades and the perseverance and imagination of tenacious theoretical physicists This book explores these different propulsion schemes all based on current physics and the challenges they present to physicists engineers and space exploration entrepreneurs This book will be helpful to anyone who really wants to understand the principles behind and likely future course of interstellar travel and who wants to recognize the distinctions between pure fantasy such as Star Trek's warp drive and methods that are grounded in real physics and offer practical technological solutions for exploring the stars in the decades to come

Deep Space Flight and Communications Claudio Maccone, 2009-06-09 The majority of books dealing with prospects for interstellar flight tackle the problem of the propulsion systems that will be needed to send a craft on an interstellar trajectory The proposed book looks at two other equally important aspects of such space missions and each forms half of this two part book Part 1 looks at the ways in which it is possible to exploit the focusing effect of the Sun as a gravitational lens for scientific missions to distances of 550 AU and beyond into interstellar space The author explains the mechanism of the Sun as a gravitational lens the scientific investigations which may be carried out along the way to a distance of 550 AU and at the 550 AU sphere itself the requirements for exiting the Solar System at the highest speed and a range of project ideas for missions entering interstellar space Part 2 of the book deals with the problems of communicating between an interstellar spaceship and the Earth especially at very high speeds Here the author assesses a range of mathematical tools relating to the Karhunen-Loève Transform KLT for optimal telecommunications technical topics that may one day enable humans flying around the Galaxy to keep in contact with the Earth This part of the book opens with a summary of the author's 2003 Pöck Lecture presented at the IAC in Bremen which introduces the concept of KLT for engineers and newcomers to the subject It is planned to include a DVD containing the full mathematical derivations of the KLT for those interested in this important mathematical tool whilst the text itself will contain the various results without outlines of the mathematical proofs Astronautical engineers will thus be able to see the application of the results without getting bogged down in the mathematics

Communication with Extraterrestrial Intelligence (CETI) Douglas A. Vakoch, 2011-04-01 In April 2010 fifty years to the month after the first experiment in the Search for Extraterrestrial Intelligence SETI scholars from a range of disciplines

including astronomy mathematics anthropology history and cognitive science gathered at NASA's biennial Astrobiology Science Conference AbSciCon for a series of sessions on the search for intelligent life This book highlights the most recent developments in SETI discussed at that conference emphasizing the ways that SETI has grown since its inception The volume covers three broad themes First leading researchers examine the latest developments in observational SETI programs as well as innovative proposals for new search strategies and novel approaches to signal processing Second both proponents and opponents of Active SETI debate whether humankind should be transmitting intentional signals to other possible civilizations rather than only listening Third constructive proposals for interstellar messages are juxtaposed with critiques that ask whether any meaningful exchange is possible with an independently evolved civilization given the constraints of contact at interstellar distances where a round trip exchange could take centuries or millennia As we reflect on a half century of SETI research we are reminded of the expansion of search programs made possible by technological and conceptual advances In this spirit of ongoing exploration the contributors to this book advocate a diverse range of approaches to make SETI increasingly more powerful and effective as we embark on the next half century of searching for intelligence beyond Earth

Searching for Extraterrestrial Intelligence H. Paul Shuch, 2011-02-14 This book is a collection of essays written by the very scientists and engineers who have led and continue to lead the scientific quest known as SETI the search for extraterrestrial intelligence Divided into three parts the first section *The Spirit of SETI Past* written by the surviving pioneers of this then emerging discipline reviews the major projects undertaken during the first 50 years of SETI science and the results of that research In the second section *The Spirit of SETI Present* the present day science and technology is discussed in detail providing the technical background to contemporary SETI instruments experiments and analytical techniques including the processing of the received signals to extract potential alien communications In the third and final section *The Spirit of SETI Future* the book looks ahead to the possible directions that SETI will take in the next 50 years addressing such important topics as interstellar message construction the risks and assumptions of interstellar communications when we might make contact what aliens might look like and what is likely to happen in the aftermath of such a contact
