Microemulsions as stepping stones to greener organic chemistry Nadja Wulff, 2015-01-16 In organic chemistry the simultaneous solubility of hydrophobic and hydrophilic reactants in a common solvent is an ubiquitous problem Often either an expensive or a toxic solvent is needed Alternatively polar and non polar components are mixed into macroemulsions permitting them to react across the internal interface However macroemulsions display a comparatively small interfacial area Thus the reaction rate is low Microemulsions feature an inherent vast interfacial area which facilitates significantly higher reaction rates Furthermore they allow a rather simple monitoring of the reaction kinetics by observing changes in the phase behavior In this work the advantages of microemulsions as efficient reaction media for the photochemically induced Patern B chi reaction of pyruvic acid and 1 octene are elucidated The amphiphilic reaction product 3 hexyl 2 methyloxetane 2 carboxylic acid influences the phase behavior of the microemulsion system significantly With increasing UV exposure time the point of highest efficiency was shifted to lower temperatures and interestingly an increase of efficiency was detected Hence the newly created amphiphile acts as an efficient hydrophobic cosurfactant Additionally with small angle neutron scattering and freeze fracture electron microscopy it was shown that the bicontinuous microstructure survives the UV irradiation Another route towards green organic chemistry was opened by characterization of two new sustainable biosurfactants mannosylerythritolipids MEL and cellobioselipids CL in microemulsions
