**Abstract.** The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and blood pressure (BP) of sedentary, middle-aged men. The subjects were 15 men, aged 40-50 years, who were sedentary and had no history of cardiovascular disease. They were divided into two groups: a control group and a training group. The control group remained sedentary, while the training group performed a 12-week aerobic exercise program. HR and BP were measured at rest and during exercise at baseline and at the end of the 12-week period. The results showed that the training group had a significant decrease in both HR and BP compared to the control group. The decrease in HR was more pronounced during exercise than at rest, and the decrease in BP was more pronounced during exercise than at rest. The findings suggest that a 12-week aerobic exercise program can effectively reduce HR and BP in sedentary, middle-aged men.
