Ecotones Between Forest and Grassland Randall W. Myster,2014-08-08 Ecotones are dynamic overlapping boundary areas where major terrestrial biomes meet As past studies have shown and as the chapters in this book will illustrate their structure size and scope have changed considerably over the millennia expanding and shrinking as climate and or other driving conditions also changed Today however many of them are changing at a rate not seen for a long time perhaps largely due to climate change and other human induced factors Indeed ecotones are more sensitive to climate change than the biomes on either side and thus may serve as critical early indicators of future climate change As ecotones change they also redefine the limits of the biomes on either side by altering their distributions of species because in addition to their own endemic species any ecotone will also have species from both adjoining biomes Consequently they may also be places of high levels of species interaction serving as active evolutionary laboratories which generate new species that then migrate back into adjacent biomes *Ecotones Between Forest and Grassland* explores how these ecotones have changed in the past how they are changing today and how they are likely to change in the future The book includes chapters from around the world with a special focus on South American and Neotropical ecotones Biomes and Ecosystems Robert Warren Howarth,Jacqueline Eugenia Mohan,2013 A resource for students and teachers to understand the importance of biomes and ecosystems to appreciate the study of ecology and how it affects life around the world to learn of the flora and fauna in biomes and ecosystems and to initiate educational discussion on the subjects *U-X-L Encyclopedia of Biomes* Marlene Weigel,2010-01-20 Information on twelve of the Earth s major biomes and their many component ecosystems P 4 of each cover
