Forecasting Financial Time Series Using Model Averaging Francesco Ravazzolo, 2007 Believing in a single model may be dangerous and addressing model uncertainty by averaging different models in making forecasts may be very beneficial In this thesis we focus on forecasting financial time series using model averaging schemes as a way to produce optimal forecasts We derive and discuss in simulation exercises and empirical applications model averaging techniques that can reproduce stylized facts of financial time series such as low predictability and time varying patterns We emphasize that model averaging is not a magic methodology which solves a priori problems of poorly forecasting Averaging techniques have an essential requirement individual models have to fit data In the first section we provide a general outline of the thesis and its contributions to previous research In Chapter 2 we focus on the use of time varying model weight combinations In Chapter 3 we extend the analysis in the previous chapter to a new Bayesian averaging scheme that models structural instability carefully In Chapter 4 we focus on forecasting the term structure of U S interest rates In Chapter 5 we attempt to shed more light on forecasting performance of stochastic day ahead price models We examine six stochastic price models to forecast day ahead prices of the two most active power exchanges in the world the Nordic Power Exchange and the Amsterdam Power Exchange Three of these forecasting models include weather forecasts To sum up the research finds an increase of forecasting power of financial time series when parameter uncertainty model uncertainty and optimal decision making are included
