[Hamstring Strengthening for Soccer Athletes](#) Thomas Gronwald,2023 INCREASING HAMSTRING INJURY RATES Muscle injury rates have not decreased over the last two decades in professional soccer neither in training nor in matches Hamstring injuries represent a very high increasing proportion of all injuries and a high injury burden These data provide a strong rationale for soccer clubs to keep focusing on risk mitigation approaches In addition recent systematic video analysis of inciting events of non contact and indirect contact hamstring injuries in professional male soccer showed how match hamstring injuries occur and supports the need for demand specific multi component risk reduction programmes Studies showing that the regular implementation of the Nordic hamstring exercise may reduce hamstring injuries by up to 50% But challenges for program implementation might be the reason that hamstring injuries are still on the rise e.g low compliance for regular implementation limited time to include risk mitigation approaches problems with appropriate implementation in crowded time schedule and prescription e.g muscle soreness Furthermore it is also very unlikely that a single exercise would be an easy to apply solution to a multi factorial injury problem THE NEED FOR A HOLISTIC APPROACH Moving away from

promoting one particular exercise or program and introducing a variety of exercises and modalities based on the knowledge of inciting events general and specific training principles instead may enhance the real world implementation in your own club environment This would provide the possibility to vary between the components or exercises and enhance creativity to a large extent and thus potentially increase motivation and compliance in both players and coaching staff for holistic program development and implementation on a regular basis This is necessary considering the multi factorial nature of hamstring injury risk mitigation approaches and all other components of a regular strength and conditioning program and soccer specific components AN EVIDENCE INFORMED GUIDE AND FRAMEWORK Therefore the present short guide and framework based on evidence informed decisions will summarize the current scientific and practical evidence of exercise based multi component risk mitigation approaches for hamstring injuries in professional soccer with the focus on exercise selection prescription and programming For the practical section a holistic approach was chosen with regard to muscle groups synergistically working together For this reason it is also explained how exercises for trunk stabilization and lumbo pelvic control as well as for strengthening the extensor muscles of the hip could help to reduce hamstring injuries Due to the high dynamic nature and complexity of hamstring injury inciting events and specific demands in soccer it is also explained how exercise tasks such as acceleration top speed sprinting and change of direction including deceleration could provide specific stimuli for hamstring injury risk mitigation **Behandeling Van Acute Hamstringblessures Bij Sporters**, 2016

The Complete Idiot's Guide to Running Injury-Free Bob Schaller, Coach Damon Martin, 2008-03-04 No pain maximum gain More than half of all runners in the U S are sidelined at least once a year because of an injury Many others run through the pain that starts to surface as they age the result of years of bad posture joint and muscle stiffness and poor running mechanics This guide provides readers with a holistic approach to preventing injuries and getting rid of nagging pains In it readers learn how to increase flexibility calibrate muscle strength pick the right shoes break bad habits and more all while improving distance and efficiency Effects of Hamstring Injury History on Frontal Plane Pelvic Mechanics Cameron Nurse, 2020 The aim of this study is to examine the differences in frontal plane running mechanics of injured runners compared to their healthy counterparts Frontal plane pelvic drop results in the knee moving into a valgus position The hamstrings are recruiting in valgus moments to stabilize the knee This extra recruitment of the hamstrings during this initial contact event could be a mechanism of injury Thirty nine subjects performed three 50 meter sprints with three Opal sensors placed on the pelvis one on each iliac crest and one on the sacrum Subjects were divided into six groups based on gender athletic ability and injury history The vertical acceleration measured by the sensors was used to discern patterns within a subject's running gait The data was used to analyze variability impact magnitude and rate instability and asymmetry during each single leg stance throughout the run to investigate between group differences Differences between injured leg and healthy leg stance were examined for the injured populations as well Analysis of the data found significant differences

between the groups Injured athlete displayed greater instability and asymmetry during injured leg stance than healthy leg stance Differences between athlete and non athlete populations for variability were present with athletes exhibiting lower variability than their non athlete counterparts This study demonstrates that within injured athletes there is difference in ground contact dynamics between injured and healthy legs These athletes might benefit from intervention and rehabilitation strategies targeting postural control and stability during dynamic tasks Author s abstract *Prevention and Treatment of Running Injuries* Robert D. D'Ambrosia,David Drez,1982 **A Comparison of Hamstring Injury Recovery Rates in Male and Female Athletes** Amanda L. Hall,2018 *Acute Muscle Injuries* Gino M.M.J.
