Handbook of Mathematical Relations in Particulate Materials Processing Randall M. German, Seong Jin Park, 2009-01-06

The only handbook of mathematical relations with a focus on particulate materials processing The National Science Foundation estimates that over 35% of materials related funding is now directed toward modeling In part this reflects the increased knowledge and the high cost of experimental work However currently there is no organized reference book to help the particulate materials community with sorting out various relations This book fills that important need providing readers with a quick reference handbook for easy consultation This one of a kind handbook gives readers the relevant mathematical relations needed to model behavior generate computer simulations analyze experiment data and quantify physical and chemical phenomena commonly found in particulate materials processing It goes beyond the traditional barriers of only one material class by covering the major areas in ceramics cemented carbides powder metallurgy and particulate materials In many cases the governing equations are the same but the terms are material specific To rise above these differences the authors have assembled the basic mathematics around the following topical structure Powder technology relations such as those encountered in atomization milling powder production powder characterization mixing particle packing and powder testing Powder processing such as uniaxial compaction injection molding slurry and paste shaping techniques polymer pyrolysis sintering hot isostatic pressing and forging with accompanying relations associated with microstructure development and microstructure coarsening Finishing operations such as surface treatments heat treatments microstructure analysis material testing data analysis and structure property relations Handbook of Mathematical Relations in Particulate Materials Processing is suited for quick reference with stand alone definitions making it the perfect complement to existing resources used by academic researchers corporate product and process developers and various scientists engineers and technicians working in materials processing

Particulate Products Henk G. Merkus, Gabriel M.H. Meesters, 2013-11-19
Particulate products make up around 80% of chemical products from all industry sectors Examples given in this book include the construction materials fine ceramics and concrete the delicacies chocolate and ice cream pharmaceutical powders medical inhalers and sun screen liquid and powder paints Size distribution and the shape of the particles provide for different functionalities in these products Some functions are general others specific General functions are powder flow and require at the typical particulate concentrations of these products that the particles cause adequate rheological behavior during processing and or for product performance Therefore this book addresses particle packing as well as its relation to powder flow and rheological behavior Moreover general relationships to particle size are discussed for e g color and sensorial aspects of particulate products Product specific functionalities are often relevant for comparable product groups Particle size distribution and shape provide for example the following functionalities dense particle packing in relation to sufficient strength is required in concrete construction ceramic objects and pharmaceutical tablets good sensorial properties mouthfeel

to chocolate and ice cream effective dissolution flow and compression properties for pharmaceutical powders adequate hiding power and effective coloring of paints for protection and the desired esthetical appeal of the objects adequate protection of our body against sun light by sunscreen effective particle transport and deposition to desired locations for medical inhalers and powder paints Adequate particle size distribution shape and porosity of particulate products have to be achieved in order to reach optimum product performance This requires adequate management of design and development as well as sufficient knowledge of the underlying principles of physics and chemistry Moreover flammability explosivity and other health hazards from powders during handling are taken into account This is necessary since great risks may be involved In all aspects the most relevant parameters of the size distribution and particle shape have to be selected In this book experts in the different product fields have contributed to the product chapters This provides optimum information on what particulate aspects are most relevant for behavior and performance within specified industrial products and how optimum results can be obtained It differs from other books in the way that the critical aspects of different products are reported so that similarities and differences can be identified We trust that this approach will lead to improved optimization in design development and quality of many particulate products

Particulate Composites Randall M. German, 2016-06-14 This book is focused on composites involving powders as the starting materials It provides relevant information for questions related to the selection of constituent phases most economic fabrication routes proper testing procedures and product optimization The field is sufficiently advanced that predictive models guide many decisions Applications are illustrated over a broad range of material and property combinations This title includes Selection of phases with consideration of intersolubility interface Microstructure especially the role of phase connectivity Fabrication approaches especially net shape consolidation Assessment of typical properties testing techniques industry standards Design trade off decisions involved in optimization including cost Applications both those that have matured and some emerging prospects The reader may have little appreciation for how particulate composites are literally everywhere Examples include new wear resistant consumer products Apple watch longer lasting automotive tires with reduced rolling resistance Yokohama tires and new diamond heat sinks for computers Element Six substrates Particulate composites also form critical components in applications such as magnets dental fillings brakes darts bio implants cutting tools Particulate composites are a multi billion dollar industry and can be a cost effective solution ripe for innovation and continued rapid growth For the engineer the wide range of particulate composite formulation and property combinations offers the ability to design for a variety of application and provides ample opportunity for innovation Particulate Composites Fundamentals Applications is ideal for use in a one semester eng course at the senior UG graduate level and is also suitable as a practical reference for materials scientists in academia and industry

Reactive transport modeling of fluid-rock interactions associated with carbonate diagenesis and implications for reservoir quality prediction Ying Xiong , 2022-07-26 Diagenesis research is the foundation of hydrocarbon reservoir characterization and exploration Reactive transport modeling RTM is an emerging approach for diagenesis research with unique capability of quantification and forward modeling of the coupled thermo hydro chemical processes of diagenesis Using TOUGHREACT simulator this thesis investigates the two most important fluid rock interactions in carbonate rocks i e dolomitization and karstification based on generic model analyses and a case study in the Ordos Basin China In particular this study attempts to quantitatively characterize the diagenetic processes and to reconstruct the diagenesis porosity evolution of carbonate reservoirs Some controversies in carbonate diagenesis research which cannot be well explained by classical geological methods have also been discussed The results are helpful to better understand the spatial temporal distribution and co evolution of diagenesis mineral porosity during the complicated diagenetic processes with their potential controlling factors and to reduce the uncertainty of reservoir quality prediction

Alloy Design and Process Innovations Prashanth Konda Gokuldoss, Zhi Wang, 2020-04-15 Additive manufacturing AM is one of the manufacturing processes that warrants the attention of industrialists researchers and scientists because of its ability to produce materials with a complex shape without theoretical restrictions and with added functionalities There are several advantages to employing additive manufacturing as the primary additive manufacturing process However there exist several challenges that need to be addressed systematically A couple such issues are alloy design and process development Traditionally alloys designed for conventional cast powder metallurgical processes were fabricated using advanced AM processes This is the wrong approach considering that the alloys should be coined based on the process characteristics and meta stable nature of the process Hence we must focus on alloy design and development for AM that suits the AM processes The AM processes however improve almost every day either in terms of processing capabilities or processing conditions Hence the processing part warrants a section that is devoted to these advancements and innovations Accordingly the present Special Issue book focuses on two aspects of alloy development and process innovations Here 45 articles are presented covering different AM processes including selective laser melting electron beam

melting laser cladding direct metal laser sintering ultrasonic consolidation wire arc additive manufacturing and hybrid manufacturing I believe that this Special Issue bears is vital to the field of AM and will be a valuable addition
