Arthropod Venom Components and Their Potential Usage Katsuhiko Konno,Gandhi Rádís-Baptista,2020-03-25 Thousands of arthropod species ranging from arachnids spiders and scorpions to hymenopterans ants bees and wasps and myriapods centipedes are venomous and use their venoms for both defense and predation These

venoms are invariably harmful to humans and some may cause serious injuries e.g. those from scorpions, spiders and wasps. Arthropod venoms are also known as rich sources of biologically active compounds and have attracted the attention of toxin researchers for years. In this century, venom component analysis has progressed considerably due to the advances in analytical techniques, in particular mass spectrometry and next generation deep DNA and RNA sequencing. As such, proteomic and peptidomic analyses using LC-MS have enabled the full analysis of venom components, revealing a variety of novel peptide and protein toxins, sequences and scaffolds potentially useful as pharmacological research tools and for the development of highly selective peptide ligands and therapeutic leads like chlorotoxin. Due to their specificity for numerous ion channel subtypes, including voltage and ligand-gated ion channels, arthropod neurotoxins have been investigated to dissect and treat neurodegenerative diseases and control epileptic syndromes. This Special Issue collects information on such progress, encouraging contributions on the chemical and biological characterization of venom components, not only peptides and proteins but also small molecules, their mechanisms of action and the development of venom-derived peptide leads.

Venom and Toxin as Targeted Therapy Hang Fai (Henry) Kwok, 2019-10-01 Targeted therapy has developed significantly in the last one and half decades, prescribing specific medications for treatment of particular diseases such as cancer, diabetes and heart disease. One of the most exciting recent developments in targeted therapies was the isolation of disease-specific molecules from natural resources such as animal venoms and plant metabolites/toxins for use as templates for new drug motif designs. In addition, the study of venom proteins, peptides and toxins naturally targeted mammalian receptors and demonstrated high specificity and selectivity towards defined ion channels of cell membranes. Research has also focused intensely on receptors. The focus of this Special Issue of *Toxins* addressed the most recent advances using animal venoms such as frog secretions, bee and ant venoms and plant/fungi toxins as medicinal therapy. Recent advances in venom toxin immunotoxins for targeted cancer therapy and immunotherapy, along with using novel disease-specific venom-based protein-peptide toxin and currently available FDA-approved drugs for combination treatments, will be discussed. Finally, we included an overview of select promising toad/snake venom-based peptides/toxins potentially able to address the forthcoming challenges in this field. Both research and review articles proposing novelties or overviews respectively were published in this Special Issue after rigorous evaluation and revision by expert peer reviewers.
