Gebotys, Mohamed I. Elmasry, 2012-12-06 Although research in architectural synthesis has been conducted for over ten years it has had very little impact on industry This in our view is due to the inability of current architectural synthesizers to provide area delay competitive or optimal architectures that will support interfaces to analog asynchronous and other complex processes They

also fail to incorporate testability The OASIC optimal architectural synthesis with interface constraints architectural synthesizer and the CATREE computer aided trees synthesizer demonstrate how these problems can be solved Traditionally architectural synthesis is viewed as NP hard and therefore most research has involved heuristics OASIC demonstrates by using an IP approach using polyhedral analysis that most input algorithms can be synthesized very fast into globally optimal architectures Since a mathematical model is used complex interface constraints can easily be incorporated and solved Research in test incorporation has in general been separate from synthesis research This is due to the fact that traditional test research has been at the gate or lower level of design representation Nevertheless as technologies scale down and complexity of design scales up the push for reducing testing times is increased One way to deal with this is to incorporate test strategies early in the design process The second half of this text examines an approach for integrating architectural synthesis with test incorporation Research showed that test must be considered during synthesis to provide good architectural solutions which minimize Xilinx area delay cost functions

**VLSI Design Methodologies for Digital Signal Processing Architectures** Magdy A. Bayoumi, 2012-12-06 Designing VLSI systems represents a challenging task It is a transformation among different specifications corresponding to different levels of design abstraction behavioral structural and physical The behavioral level describes the functionality of the design It consists of two components static and dynamic The static component describes operations whereas the dynamic component describes sequencing and timing The structural level contains information about components control and connectivity The physical level describes the constraints that should be imposed on the floor plan the placement of components and the geometry of the design Constraints of area speed and power are also applied at this level To implement such multilevel transformation a design methodology should be devised taking into consideration the constraints limitations and properties of each level The mapping process between any of these domains is non isomorphic A single behavioral component may be transformed into more than one structural component Design methodologies are the most recent evolution in the design automation era which started off with the introduction and subsequent usage of module generation especially for regular structures such as PLAs and memories A design methodology should offer an integrated design system rather than a set of separate unrelated routines and tools A general outline of a desired integrated design system is as follows Decide on a certain unified framework for all design levels Derive a design method based on this framework Create a design environment to implement this design method

*Civil Structures and Infrastructure Systems: From Reliability to Resilience* Cao Wang, 2025-08-01 Civil Structures and Infrastructure Systems From Reliability to Resilience examines the reliability and resilience of individual structures outlining their similarity difference through a unified framework Subsequently the reliability and resilience of infrastructure systems consisting of interacting multiple components are considered with an emphasis on the wide applicability of reliability and resilience theories in engineering practice Systematically introduces the concept mathematical formulation application and comparison
