

Life - Angle of Attack

Angle of Attack

Angle of attack is the angle a wing makes with oncoming airflow. Increasing the angle of attack will result in the plane going upwards and decreasing the angle of attack will lower the plane.

The chord line is the line from one side of the wing to the other. The relative wind is the oncoming air that the wings will travel through. With air being a fluid, the plane and its wings are travelling through the air particles.

When an airplane takes off, it travels very fast down the runway. While it is on the ground, its wing angle will be very small, around 3 degrees. After it picks up enough speed, the nose of the airplane will lift off, increasing the angle of attack to around 15 degrees. This will cause lift off for the airplane.

Once the airplane is in flight at an appropriate altitude, its angle of attack needs to become much less than 15 degrees, or it could stall. The airplane will settle around 5 degrees while it is in flight.

Stalling means the aircraft has lost or reduced its lift because its angle of attack was increased too much. The angle where an aircraft will stall is called the critical angle of attack. Stalling means air cannot travel above the wing as it strikes the front of the wing causing a lot of drag.
