

Immunology: Mucosal and Body Surface Defences

Andrew E. Williams

- Covers the basic aspects of immunology with a particular focus on the mucosa, the largest immune organ in the body. The main site of pathogen entry is through mucosal tissues yet this very important area of immunology has never been covered fully in any other text.
- Provides a step-by-step explanation of how the immune system clears pathogens from the host from the moment the pathogen enters the host to the moment it is destroyed by the immune system. Other texts concentrate on basic immunology/development of the immune system and therefore neglect the fundamental role of the immune system, which is to fight infections.
- Modern, and exciting topics of immunology are detailed throughout each chapter. Most texts fail to enlighten the student about up to date topics that are at the cutting edge of immunology. This book readdresses the balance by providing the reader with the latest information about modern immunology.
- Covers certain topics of modern immunology that other texts have not covered. For example, a chapter devoted to the immunology and biology of 2018mucosal immunity', 2018cytokines and chemokines' and 2018homeostasis and immune surveillance' is included. Although these are vital areas of modern immunology they have received little attention from many standard texts.
- Each chapter contains boxed areas of text containing for example case studies, techniques or recent developments worthy of the public's attention.
- The book includes an associated website containing a range of support material for lecturers including a complete set of the figures included within the text, and printable lecture handouts.

Immunology and Microbiology Leigh Barnes, 2018-06-22 Immunology is the study of our protection from foreign macromolecules or invading organisms and our responses to them These invaders include viruses bacteria protozoa or even larger parasites In addition we develop immune responses against our own proteins in autoimmunity and against our own aberrant cells in tumor immunity The body is defended by innate immune responses but these will only work to control pathogens that have certain molecular patterns or that induce interferons and other secreted yet non specific defenses They do not allow memory to form as they operate by receptors that are coded in the genome Microbiology is the study of microorganisms that is the organisms which are of microscopic dimensions These organisms are too small to be clearly perceived by the unaided human eye If an object has a diameter of less than 0.1 mm the eye can not perceive it at all and very little detail can be perceived in an object with a diameter of 1 mm Microorganisms benefit society by cycling inorganic and organic matter into molecules needed for life and detoxifying discarded wastes Historically they have served as microscopic factories for the production of cheeses alcohol and antibiotics Microorganisms have also been engineered to produce a wide variety of products for our benefit through the emergence of biotechnology Microorganisms have however also inflicted great distress to human animal and plant populations through disease spoilage of crops foods and the fouling and degradation of man made structures The main aim of this book is to understand and interpret the major current topics in the field of immunology and microbiology
