Linear Optimization Problems with Inexact Data Miroslav Fiedler, Josef Nedoma, Jaroslav Ramik, Jiri Rohn, Karel Zimmermann, 2006-07-18

Linear programming attracted the interest of mathematicians during and after World War II when the first computers were constructed and methods for solving large linear programming problems were sought in connection with specific practical problems for example providing logistical support for the U S Armed Forces or modeling national economies Early attempts to apply linear programming methods to solve practical problems failed to satisfy expectations There were various reasons for the failure One of them which is the central topic of this book was the inexactness of the data used to create the models This phenomenon inherent in most practical problems has been dealt with in several ways At first linear programming models used average values of inherently vague coefficients but the optimal solutions of these models were not always optimal for the original problem itself Later researchers developed the stochastic linear programming approach but this too has its limitations Recently interest has been given to linear programming problems with data given as intervals convex sets and or fuzzy sets The individual results of these studies have been promising but the literature has not presented a unified theory

Linear Optimization Problems with Inexact Data attempts to present a comprehensive treatment of linear optimization with inexact data summarizing existing results and presenting new ones within a unifying framework

Pattern Recognition on Oriented Matroids Andrey O. Matveev, 2017-09-11

Pattern Recognition on Oriented Matroids covers a range of innovative problems in combinatorics poset and graph theories optimization and number theory that constitute a far reaching extension of the arsenal of committee methods in pattern recognition The groundwork for the modern committee theory was laid in the mid 1960s when it was shown that the familiar notion of solution to a feasible system of linear inequalities has ingenious analogues which can serve as collective solutions to infeasible systems A hierarchy of dialects in the language of mathematics for instance open cones in the context of linear inequality systems regions of hyperplane arrangements and maximal covectors or topes of oriented matroids provides an excellent opportunity to take a fresh look at the infeasible system of homogeneous strict linear inequalities the standard working model for the contradictory two class pattern recognition problem in its geometric setting The universal language of oriented matroid theory considerably simplifies a structural and enumerative analysis of applied aspects of the infeasibility phenomenon The present book is devoted to several selected topics in the emerging theory of pattern recognition on oriented matroids the questions of existence and applicability of matroidal generalizations of

committee decision rules and related graph theoretic constructions to oriented matroids with very weak restrictions on their structural properties a study in which in particular interesting subsequences of the Farey sequence appear naturally of the hierarchy of the corresponding tope committees a description of the three tope committees that are the most attractive approximation to the notion of solution to an infeasible system of linear constraints an application of convexity in oriented matroids as well as blocker constructions in combinatorial optimization and in poset theory to enumerative problems on tope committees an attempt to clarify how elementary changes one element reorientations in an oriented matroid affect the family of its tope committees a discrete Fourier analysis of the important family of critical tope committees through rank and distance relations in the tope poset and the tope graph the characterization of a key combinatorial role played by the symmetric cycles in hypercube graphs Contents Oriented Matroids the Pattern Recognition Problem and Tope Committees Boolean Intervals Dehn Sommerville Type Relations Farey Subsequences Blocking Sets of Set Families and Absolute Blocking Constructions in Posets Committees of Set Families and Relative Blocking Constructions in Posets Layers of Tope Committees Three Tope Committees Halfspaces Convex Sets and Tope Committees Tope Committees and Reorientations of Oriented Matroids Topes and Critical Committees Critical Committees and Distance Signals Symmetric Cycles in the Hypercube Graphs *Convex Optimization Techniques for Geometric Covering Problems* Jan Hendrik Rolfes, 2021-09-15

The present thesis is a commencement of a generalization of covering results in specific settings such as the Euclidean space or the sphere to arbitrary compact metric spaces In particular we consider coverings of compact metric spaces $X \subset \mathbb{R}^d$ by balls of radius r We are interested in the minimum number of such balls needed to cover X denoted by $N_{\text{cal}}(X, r)$ For finite X this problem coincides with an instance of the combinatorial textsc set cover problem which is $\text{mathrm{NP}}$ complete We illustrate approximation techniques based on the moment method of Lasserre for finite graphs and generalize these techniques to compact metric spaces X to obtain upper and lower bounds for $N_{\text{cal}}(X, r)$ The upper bounds in this thesis follow from the application of a greedy algorithm on the space X Its approximation quality is obtained by a generalization of the analysis of Chvátal's algorithm for the weighted case of textsc set cover We apply this greedy algorithm to the spherical case $X \subset S^n$ and retrieve the best non asymptotic bound of Borsuk and Wintsche Additionally the algorithm can be used to determine coverings of Euclidean space with arbitrary measurable objects having non empty interior The quality of these coverings slightly improves a bound of Naszodi For the lower bounds we develop a sequence of bounds $N_{\text{cal}}(t, X, r)$ that converge after finitely say α in N many steps $N_{\text{cal}}(1, X, r) \leq \dots \leq N_{\text{cal}}(\alpha, X, r) \leq N_{\text{cal}}(X, r)$ The drawback of this sequence is that the bounds $N_{\text{cal}}(t, X, r)$ are increasingly difficult to compute since they are the objective values of infinite dimensional conic programs whose number of constraints and dimension of underlying cones grow accordingly to t We show that these programs satisfy strong duality and derive a finite dimensional semidefinite program to approximate $N_{\text{cal}}(2, S^2, r)$ to arbitrary precision Our results rely in part on the moment methods developed by de Laat and Vallentin for the packing problem on

topological packing graphs However in the covering problem we have to deal with two types of constraints instead of one type as in packing problems and consequently additional work is required *Linear Optimization and Extensions*
