Study on Data Placement Strategies in Distributed RDF Stores Daniel Dominik Janke,2020-03-15 The distributed setting of RDF stores in the cloud poses many challenges including how to optimize data placement on the compute nodes to improve query performance In this book a novel benchmarking methodology is developed for data placement strategies one that overcomes these limitations by using a data placement strategy independent distributed RDF store to analyze the effect of the data placement strategies on query performance Frequently used data placement strategies have been evaluated and this evaluation challenges the commonly held belief that data placement strategies which emphasize local computation lead to faster query executions Indeed results indicate that queries with a high workload can be executed faster on hash based data placement strategies than on for example minimal edge cut covers The analysis of additional measurements indicates that vertical parallelization i e a well distributed workload may be more important than

horizontal containment i.e. minimal data transport for efficient query processing Two such data placement strategies are proposed the first found in the literature is entitled overpartitioned minimal edge cut cover and the second is the newly developed molecule hash cover Evaluation revealed a balanced query workload and a high horizontal containment which lead to a high vertical parallelization As a result these strategies demonstrated better query performance than other frequently used data placement strategies The book also tests the hypothesis that collocating small connected triple sets on the same compute node while balancing the amount of triples stored on the different compute nodes leads to a high vertical parallelization

LogiQL Terry Halpin, Spencer Rugaber, 2014-11-13 LogiQL is a new state of the art programming language based on Datalog It can be used to build applications that combine transactional analytical graph probabilistic and mathematical programming LogiQL makes it possible to build hybrid applications that previously required multiple programming languages and databases In this first book to cover LogiQL the authors explain how to design implement and query deductive databases using this new programming language LogiQL's declarative approach enables complex data structures and business rules to be simply specified and then automatically executed It is especially suited to business applications requiring complex rules to be implemented efficiently for example predictive analytics and supply chain optimization Suitable for both novices and experienced developers the book is written in easy to understand language It includes many examples and exercises throughout to illustrate the main concepts and consolidate understanding

Reasoning Web. Learning, Uncertainty, Streaming, and Scalability Claudia d'Amato, Martin Theobald, 2018-09-14 This volume contains lecture notes of the 14th Reasoning Web Summer School RW 2018 held in Esch sur Alzette Luxembourg in September 2018 The research areas of Semantic Web Linked Data and Knowledge Graphs have recently received a lot of attention in academia and industry Since its inception in 2001 the Semantic Web has aimed at enriching the existing Web with meta data and processing methods so as to provide Web based systems with intelligent capabilities such as context awareness and decision support The Semantic Web vision has been driving many community efforts which have invested a lot of resources in developing vocabularies and ontologies for annotating their resources semantically Besides ontologies rules have long been a central part of the Semantic Web framework and are available as one of its fundamental representation tools with logic serving as a unifying foundation Linked Data is a related research area which studies how one can make RDF data available on the Web and interconnect it with other data with the aim of increasing its value for everybody Knowledge Graphs have been shown useful not only for Web search as demonstrated by Google Bing etc but also in many application domains

Recent Trends in Computational Intelligence Enabled Research Siddhartha Bhattacharyya, Paramartha Dutta, Debabrata Samanta, Anirban Mukherjee, Indrajit Pan, 2021-07-31 The field of computational intelligence has grown tremendously over that past five years thanks to evolving soft computing and artificial intelligent methodologies tools and techniques for envisaging the essence of intelligence embedded in real life observations Consequently scientists have been able to explain and understand real life processes and practices which previously often remain unexplored by virtue of their underlying imprecision uncertainties and redundancies and the unavailability of appropriate methods for describing the incompleteness and vagueness of information represented With the advent of the field of computational intelligence researchers are now able to explore and unearth the intelligence otherwise insurmountable embedded in the systems under consideration Computational Intelligence is now not limited to only specific computational fields it has made inroads in signal processing smart manufacturing predictive control robot navigation smart cities and sensor design to name a few

Recent Trends in Computational Intelligence Enabled Research Theoretical Foundations and Applications explores the use of this computational paradigm across a wide range of applied domains which handle meaningful information Chapters investigate a broad spectrum of the applications of computational intelligence across different platforms and disciplines expanding our knowledge base of various research initiatives in this direction This volume aims to bring together researchers engineers developers and practitioners from academia and industry working in all major areas and interdisciplinary areas of computational intelligence communication systems computer networks and soft computing Provides insights into the theory algorithms implementation and application of computational intelligence techniques Covers a wide range of applications of deep learning across various domains which are researching the applications of computational intelligence Investigates novel techniques and reviews the state of the art in the areas of machine learning computer vision soft computing techniques

Semantic Web Technologies for Intelligent Engineering Applications Stefan Biffl, Marta Sabou, 2016-11-14 This is the first book to explore how Semantic Web technologies SWTs can be used to create intelligent engineering applications IEAs Technology specific chapters reflect the state of the art in relevant SWTs and offer guidelines on how they can be applied in multi disciplinary engineering settings characteristic of engineering production systems In addition a selection of case studies from various engineering domains demonstrate how SWTs can be used to create IEAs that enable for example defect detection or constraint checking

Part I Background and Requirements of Industrie 4.0 for Semantic Web Solutions provides the background information

needed to understand the book and addresses questions concerning the semantic challenges and requirements of Industrie 4.0 and which key SWT capabilities may be suitable for implementing engineering applications. In turn, Part II Semantic Web Enabled Data Integration in Multi-Disciplinary Engineering focuses on how SWTs can be used for data integration in heterogeneous multi-disciplinary engineering settings typically encountered in the creation of flexible production systems. Part III Creating Intelligent Applications for Multi-Disciplinary Engineering demonstrates how the integrated engineering data can be used to support the creation of IEAs while Part IV Related and Emerging Trends in the Use of Semantic Web in Engineering presents an overview of the broader spectrum of approaches that make use of SWTs to support engineering settings. A final chapter then rounds out the book with an assessment of the strengths, weaknesses, and compatibilities of SWTs and an outlook on future opportunities for applying SWTs to create IEAs in flexible industrial production systems. This book seeks to build a bridge between two communities: industrial production on one hand and Semantic Web on the other. Accordingly, stakeholders from both communities should find this book useful in their work. Semantic Web researchers will gain a better understanding of the challenges and requirements of the industrial production domain, offering them guidance in the development of new technologies and solutions for this important application area. In turn, engineers and managers from engineering domains will arrive at a firmer grasp of the benefits and limitations of using SWTs, helping them to select and adopt appropriate SWTs more effectively. In addition, researchers and students interested in industrial production-related issues will gain valuable insights into how and to what extent SWTs can help to address those issues.
