Limit State of Materials and Structures Géry de Saxcé, Abdelbacet Oueslati, Eric Charkaluk, Jean-Bernard Tritsch, 2012-10-18 To determine the carrying capacity of a structure or a structural element susceptible to operate beyond the elastic limit is an important task in many situations of both mechanical and civil engineering The so called direct methods play an increasing role due to the fact that they allow rapid access to the request information in mathematically constructive manners They embrace Limit Analysis the most developed approach now widely used and Shakedown Analysis a powerful extension to the variable repeated loads potentially more economical than step by step inelastic analysis This book is the outcome of a workshop held at the University of Sciences and Technology of Lille The individual contributions stem from the areas of new numerical developments rendering this methods more attractive for industrial design extension of the general methodology to new horizons probabilistic approaches and concrete technological applications

Linear and Nonlinear Optimization Igor Griva, Stephen G. Linear and Nonlinear Optimization Richard W. Cottle, Mukund N. Thapa, 2017-06-11 This textbook on Linear and Nonlinear Optimization is intended for graduate and advanced undergraduate students in operations research and related fields It is both literate and mathematically strong yet requires no prior course in optimization As suggested by its title the book is divided into two parts covering in their individual chapters LP Models and Applications Linear Equations and Inequalities The Simplex Algorithm Simplex Algorithm Continued Duality and the Dual Simplex Algorithm Postoptimality Analyses Computational Considerations Nonlinear NLP Models and Applications Unconstrained Optimization Descent Methods Optimality Conditions Problems with Linear Constraints Problems with Nonlinear Constraints Interior Point Methods and an Appendix covering Mathematical Concepts Each chapter ends with a set of exercises The book is based on lecture notes the authors have used in numerous optimization courses the authors have taught at Stanford University It emphasizes modeling and numerical algorithms for optimization with continuous not integer variables The discussion presents the underlying theory without always focusing on formal mathematical proofs which can be found in cited references Another feature of this book is its inclusion of cultural and historical matters most often appearing among the footnotes This book is a real gem The authors do a masterful job of rigorously presenting all of the relevant theory clearly and concisely while managing to avoid unnecessary tedious mathematical details This is an ideal book for teaching a one or two semester masters level course in optimization it broadly covers linear and nonlinear programming effectively balancing modeling algorithmic theory computation implementation illuminating historical facts and numerous interesting examples and exercises Due to the clarity of the exposition this book also serves as a valuable reference for self study Professor Ilan

science and engineering The book is intended for nal year undergraduate students in mathematics or other subjects with a high mathematical or computational content and exercises are provided at the end of most sections The material should also be useful for postgraduate students and other researchers and practitioners who may be concerned with the development or use of optimization algorithms It is assumed that readers have an understanding of the algebra of matrices and vectors and of the Taylor and mean value theorems in several variables Prior experience of using computational techniques for solving systems of linear equations is also desirable as is familiarity with the behaviour of iterative algorithms such as Newton's method for nonlinear equations in one variable Most of the currently popular methods for continuous nonlinear optimization are described and given at least an intuitive justification Relevant convergence results are also outlined and we provide proofs of these when it seems instructive to do so This theoretical material is complemented by numerical illustrations which give an insight of how the methods perform in practice Nonlinear Optimization and Applications Gianni Pillo, F.

automatic control engineering etc and a wealth of literature is devoted to this subject The first computer applications involved linear programming problems with simple structure and comparatively uncomplicated nonlinear problems These could be solved readily with the computational power of existing machines more than 20 years ago Problems of increasing size and nonlinear complexity made it necessary to develop a complete new arsenal of methods for obtaining numerical results in a reasonable time The linearization method is one of the fruits of this research of the last 20 years It is closely related to Newton's method for solving systems of linear equations to penalty function methods and to methods of nondifferentiable optimization It requires the efficient solution of quadratic programming problems and this leads to a connection with conjugate gradient methods and variable metrics This book written by one of the leading specialists of optimization theory sets out to provide for a wide readership including engineers economists and optimization specialists from graduate student level on a brief yet quite complete exposition of this most effective method of solution of optimization problems
